Executive Summary

Tauranga City Council (TCC) has engaged Beca Ltd (Beca) to provide planning, transportation and civil engineering services as part of an access investigation for residential zoned land in Ohauiti (the site).

The current TCC Long-term Plan (2021-31) stresses the need to find ways to make more housing availability a reality over the next decade and ensure there is balance between increasing housing options in established suburbs, creating more compact housing and providing housing options in new growth areas.

TCC's purpose of this work is to provide a sufficient road access and services route to enable residential development of the approx. 13 ha of underdeveloped residential zoned land.

The purpose of this technical assessment is to:

- identify all reasonably practicable options for access to the residentially zoned land
- assess the advantages and disadvantages of the options including the potential effects on the environment
- · recommend a preferential access option for more detailed assessment / consideration
- prepare a concept design and indicative cost estimate for the preferred option to inform further assessment / consideration.

This report will inform the consideration given by TCC to alternative access routes, or other methods for the purposes of the Public Works Act 1981 or Notice of Requirement processes under the Resource Management 1991, if those processes are pursued by the Council.

The site is located between Pukemapu Road and Hollister Lane in Ohauiti. The site is zoned residential in the TCC City Plan. Existing access to the site is via Pukemapu Road. The approximate site boundary is shown in red within the following figure.

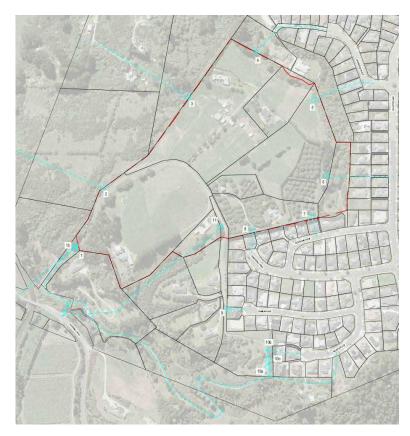

An assessment of the site and surrounding area identified the following matters of particular relevance for the access investigation:

- In general, land and transport facilities are more developed to the east of the site (toward Hollister Lane), for example:
 - Rowesdale Drive and Hollister Lane have footpaths and there is a bus route (Route 55) operating
 on Hollister Lane that provides travel options. There are limited footpaths and no public bus service
 operating on Pukemapu Road or Oropi Road.
 - There are small reserve amenities within the Rowesdale area and TCC are working on a plan to zone a small local centre (shops) in Ohauiti. There are no equivalent or planned nearby amenities in the Pukemapu / Oropi Road area.
 - There is multiple owned land to the west and north of the site including several titles of 'Maori
 Freehold Land'. Providing access through these areas would potentially impose adverse effects on
 lwi and create additional complexities with the acquisition process under the Public Works Act
 1981.
- Road network operation is constrained at both the Poike Road and Oropi Road intersections with State Highway 29. There is no local street connection between Ohauiti Road and Oropi Road, therefore requiring local trips to use SH29A.
- Additional development traffic from the site will add to existing traffic congestion. Access routes with
 greater provision for walking, cycling and public transport will have lower vehicle trip generation / impact
 on congested routes. As the site is zoned residential it is assumed to be developed in longer term studies
 such as UFTI and the Transport System Plan. These projects aim to improve the operation of the
 transport system city-wide.
- There is restricted visibility at the existing site access with Pukemapu Road and a single lane bridge between the access and Oropi Road. The bridge is not a constraint in terms of vehicle capacity, but it does not have any provision for walking or cycling.
- The site has some steep slopes, gullies, relic slips and overland flow paths that have been considered in the option development and evaluation.
- The majority of the reasonably practical access route options would cross records of title which are subject to land covenants prohibiting use of the land for any purpose other than residential use.
- Additionally, in many cases, the parcels of land within the route options are subject to right of way
 easements. If the Council were required to exercise its compulsory acquisition powers under the PWA to
 acquire land for those options, it would also likely need to use those powers to acquire the easement
 rights of those grantees under the affected rights of way, adding additional parties and an additional
 complexity to any compulsory acquisition process

A long list of 11 reasonably practicable access route options were identified by the project team. The route options within the long list are shown below.

Several concept sketches were developed depicting the various routes to inform assessment of the options. The concept sketches (Appendix A) allowed the project team to consider the potential impacts of the options on surrounding land.

A multi criteria assessment (MCA) of the options was completed by the specialists and reviewed with the TCC team. The following table shows a simplified output of the MCA, the full MCA including commentary on the scoring is provided in Appendix C.

Criteria	Option Scoring (Average Result from MCA see full MCA in Appendix C for Detailed Scoring)											
	1	1b	2	3	4	5	6	7	8	9	10a	11
Transport	-	-	-		+	++	++	++	++	+	+	-
Geotechnical and Infrastructure	-	-	-	-		-	-	0	++	-	0	-
Social / Cultural	О	0	-	-	-	o	О	+	О	О	-	0
Natural and Physical Environment	0	0	0					0	0	-	-	-
Site Acquisition					-	-	-	0	+++	-		-
Consentability					-	-	-	+	+	-	-	-
Development outcomes	+++	+++	+++	+++	-	-	-	+++	+++	+++	+++	+++

Options 6, 7 and 8 achieved overall positive scores with option 8 (Rowesdale Drive connection) achieving the highest score. Option 7 was second. Both options 8 and 7 scored positively for transport, land ownership, geotechnical and constructability criteria. Other options had higher risks on geotechnical, cultural, site acquisition and other criteria which impacted the outcome. Option 8 requires one full property and impacts on the boundary of one additional property, both of these properties are owned by TCC.

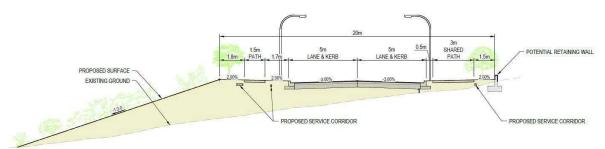

Option 8 is subject to a land covenant prohibiting any uses of land other than residential use. However, the same or similar covenants are registered on most of the potentially affected titles to the eastern side of the site.

The design philosophy for the access following Route 8 is to create a 20m wide accessway in accordance with the TCC Street Design Guide. Within the 20m road corridor a 1.5m footpath is allowed for on one side and a 3m shared path on the other. TCC own two properties at the end of Rowesdale Drive and the design utilises one of these properties fully. At this stage a small area of the second property is required, however the house can potentially remain and could be sold on after construction.

A concept design of the preferred option has been developed as shown below. The cost estimate of the option is approximately \$2.9M excluding TCC project costs (e.g. project management and property costs).

Concept Design - Plan

Concept Design Cross-section

The option will require further design investigation and/or Regional and Territorial Authority resource consents and it is recommended that an Archaeological Authority to modify or destroy unknown archaeological sites is also obtained from Heritage New Zealand.

In conclusion the process followed has been robust and all reasonably practicable options have been considered. The preferred option has more benefit and less associated impacts than the other options when considered against a broad range of criteria.

1 Introduction

1.1 Background

The Tauranga City Council (TCC) has engaged Beca Ltd (Beca) to investigate access options (vehicle and walking / cycling provisions) for an area of residential zoned land in Ohauiti which currently has limited access with the surrounding area.

The site is located in the vicinity of Hollister Lane and Pukemapu Road in Ohauiti. The approximate location of the site is shown in **Figure 1**.

Figure 1: Approximate Location of the Site (within the boundary shown in Red)

The area identified in Figure 1 is zoned Suburban Residential in the operative Tauranga City Plan.

1.2 Urban Growth and Housing Supply Challenges

Tauranga City and the Western Bay of Plenty have seen a rapid and sustained increase in population, with Tauranga City experiencing the bulk of this growth, its population doubling in the past 30 years to over 150,000 residents and 58,000 dwellings. This trend is expected to continue with the sub-region's population expected to increase to 281,960 in the next 30 years.

While this rapid growth continues, Tauranga City remains the fourth smallest territorial authority by land area, with 135km² and the fifth highest city population in New Zealand. In January 2021 areas at Tauriko West, Keenan Road and Tara Road moved from the Western Bay of Plenty District into the Tauranga City local authority area through the Local Government Commission. This recognises the continued rapid growth and

expansion of Tauranga, constrained by geography and the need to preserve significant cultural and natural areas, as well as areas constrained by natural hazard risk.

This presents a challenge in accommodating future population growth in a sustainable way. There is limited greenfield land to accommodate population growth, and constraints exist in the cost and delivery of infrastructure to service that land and meet National Policy Statement requirements, while trying to balance affordable housing opportunities. This introduces a further issue in the finite nature of the land that can be efficiently serviced with infrastructure, and an inherent need to maximise the use of the land resource.

A residential development capacity shortfall is projected across the city. This shortfall will have significant impacts on the housing market in Tauranga. This has been independently confirmed by NZIER in 2020. NZIER assessed the shortage would increase median house prices in the short term by \$40,000 to \$60,000 per annum and over the medium term a loss of construction GDP of over \$100 million (up to \$240 million on high-end shortfall projections).

The current Long-term Plan (2021-31) stresses the need to find ways to make more housing availability a reality over the next decade and ensure there is balance between increasing housing options in established suburbs – creating more compact housing - and providing housing options in new growth areas.

TCC needs to invest over \$2.6 billion over the next 10 years to establish more liveable places and homes within the current footprint of the city, as well as laying the groundwork for additional homes and businesses in new areas.

TCC has already invested in this area as part of the Ohauiti structure plan, in particular by delivering the three waters and transport network in Ohauiti. Given the city's financial challenges and constraints (as per the LTP) this is a significant driver. This infrastructure has capacity to accommodate development with low or no additional cost as it was designed and built on the basis that land within the site would be developed as per its residential zoning.

1.3 Purpose

TCC has identified the overarching purpose of this work as to provide sufficient road access and services route to enable residential development of the residential zoned land identified.

The purpose of this technical assessment is to:

- identify all reasonably practicable options for access to the residentially zoned land
- assess the advantages and disadvantages of the options including the potential effects on the environment
- recommend a preferential access option for more detailed assessment / consideration
- prepare a concept design and indicative cost estimate for the preferred option to inform further assessment / consideration.

This report does not address consultation or engagement with interested or affected parties, which is undertaken separately by TCC.

This report will inform the consideration given by TCC to alternative access routes, or other methods for the purposes of the Public Works Act 1981 or Notice of Requirement processes under the Resource Management 1991, if those processes are pursued by the Council.

This report is set out over the following chapters:

- Policy context: key policies influencing the access planning and evaluation at a high level
- **Transport context**: describes the receiving transport environment to inform option identification and evaluation

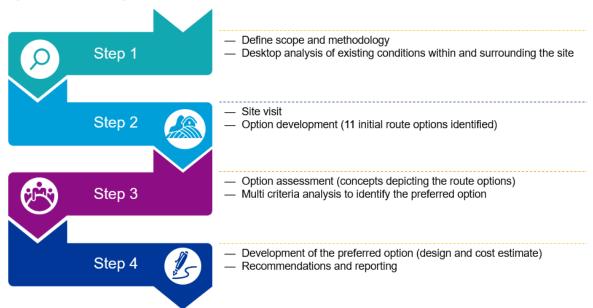

- **Civil infrastructure context**: describes existing services and topography within the vicinity of the site to inform option identification and evaluation
- Long list option development: Describes the route options identified as potentially feasible for providing access to the site
- **Scenario sketches**: describes the necessary cross section and applies this to route options to inform a multicriteria assessment (MCA) of the options
- Option evaluation: process and results of the MCA of the options
- Development of highest ranked option: concept design and cost information for the preferred option.

1.4 Process

This report has been informed through site visits, technical desktop analysis, evaluation of concept design options and a multi criteria assessment of the options, as depicted below.

Figure 2: Process Diagram

2 Policy Context

The site access and future development will need to adhere to the policy requirements set out in the Tauranga City Plan (TCP), and should support the land use and transport direction given in the Urban Form and Transport Initiative (UFTI) as discussed below.

2.1 Tauranga City Plan

The TCP enables TCC to carry out its functions under the Resource Management Act 1991 (RMA); promoting the sustainable management of natural and physical resources and includes provisions (objectives, policies, rules, anticipated environmental outcomes) to guide the use, development and subdivision of land.

The following objectives and policies from the TCP are relevant when considering the purpose of this work.

4B.1.1 Objective – Promoting an Integrated Transport Network

Subdivision, use and development of land facilitates and encourages the use of alternative modes of transport, in particular walking, cycling and public transport.

4B.1.1.2 Policy - Encouraging Alternative Transport

By ensuring that land-use and subdivision activities that have significant transport implications or present an opportunity to facilitate alternative modes of transport are designed to provide for walking, cycling and public transport facilities that:

- a. Address any identified need for new facilities or networks;
- Enhance existing facilities or networks.

12B.1.1.1 Policy - Subdivision in the Residential Zone

By ensuring that subdivision design and allotment sizes:

- a. Incorporate good urban design principles by:
 - 1. Providing a safe and efficient transport network that effectively integrates with the surrounding area;
 - 2. Providing for safe and direct movement through and between neighbourhoods for pedestrians, cyclists and vehicles;
 - 3. Providing for efficient public transport layouts;
 - 4. Optimising allotment frontage to public roads and reserves;
 - 5. Providing easy access to open space and reserves;
 - 6. Providing good solar orientation of residential allotments, open space and reserves;
 - 7. Providing a variety of allotment sizes;
 - 8. Retaining and integrating natural features;
 - 9. Generally avoiding cul-de-sacs where these are not associated with topographical constraints.

2.2 Urban Form and Transport Initiative

UFTI focuses on supporting liveable community outcomes in the areas of housing capacity, intensification, multi-modal transport (such as public transport, walking and cycling), safety and network capacity.

In the context of the intended use of this site, residential development would align with the UFTI in regard to increased housing supply within the existing urban area. It will be necessary, to provide access that supports multi-modal transport and encourages local trip making, i.e. supports direct access to local opportunities, to align with the transport objectives of UFTI.

The Transport System Plan (TSP) identifies transport system modal priorities (bus, cycle, car, freight etc) across the city that also inform the access investigation and are considered further in the following chapter.

3 Transport Context

3.1 Existing Transport Environment

3.1.1 Site Location

The site is located in Ohauiti, Tauranga. The site is currently made up of multiple rural-residential properties which are accessed via a formed accessway on to Pukemapu Road (to the South). The site is bordered by the nearby roads of Oropi Road, Pukemapu Road and Rowesdale Drive (**Figure 3**). In the wider area to the site are strategic road connections including State Highway 29, 29A, and 36.

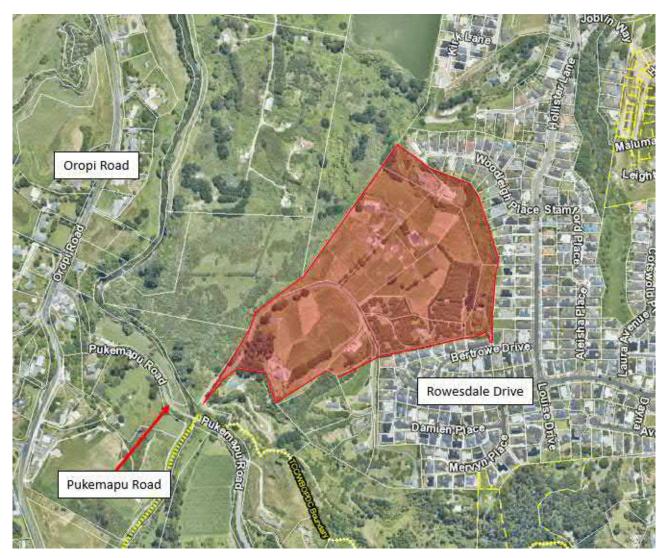

Figure 3: Local Site Area

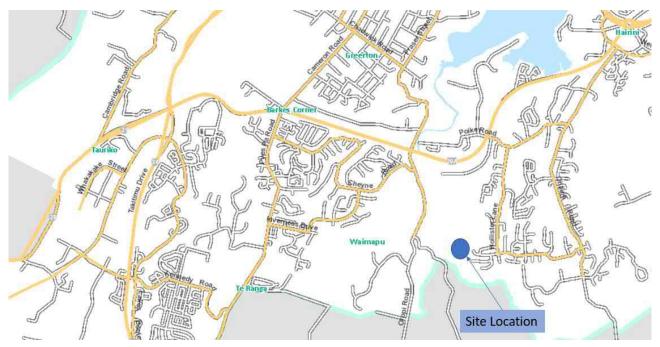

Figure 4: Strategic Site Location Showing Arterial and State Highway Access Routes

3.2 Surrounding Land Use

The site is zoned Suburban Residential in the TCP.

The site is surrounded by:

- Residential properties within the developed subdivision to the east
- · Multiple owned rural residential land to the north and west
- Rural land to the south (the site is near the boundary with the Western Bay of Plenty).

Employment

No major businesses or employment centres are located within the immediate area of the site. Several small businesses are located on Oropi Road. These include a petrol station/garage and garden centre.

Education

There are no schools or other education facilities in the immediate areas around the site. The nearest schools to the site are located in Welcome Bay and Pyes Pa. Access to these schools is made via State Highway 29A.

TCC is working with the Ministry of Education on options to locate a primary school in Ohauiti. This would improve local accessibility for school trips and reduce the need for children to be driven to schools that are located further away.

Bay of Plenty Polytechnic Toi Ohomai is located to the north of the site in Windermere.

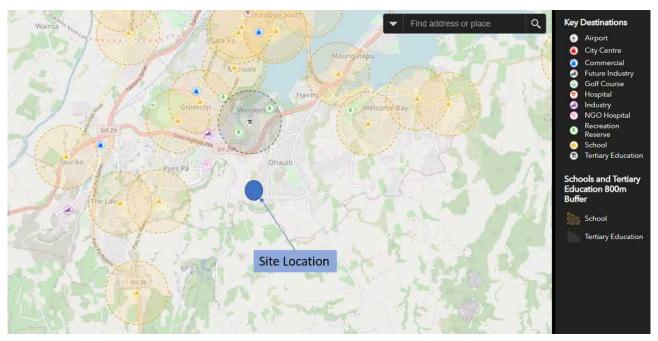

Figure 5: Schools (yellow label with 800m radius buffers) and Tertiary Education (black label and buffer) near the Site

Local Amenities

Several small parks and reserves are located close to the site. These include the Rowesdale Drive Reserve, Laura Avenue Reserve and Ohauiti Reserve. The Oropi mountain bike park is located approximately 2.5km north of the Oropi Road / Pukemapu Road intersection.

TCC is working on a Welcome Bay and Ohauiti planning study that considers opportunities to increase local amenities, possibly a small local centre, in Ohauiti. This would reduce the need to drive for local trips from the site by reducing the distance to these facilities.

3.3 Walking and Cycling

Generally, there are footpaths on all roads within the Rowesdale / Hollister Lane subdivision to the east of the site and limited footpaths or cycle facilities on Pukemapu Road or Oropi Road west of the site.

- Rowesdale Drive has footpaths on both sides and no cycle lanes / facilities
- Hollister Lane has footpaths on both sides and no cycle lanes / facilities
- Pukemapu Road has no footpaths and no cycle lanes / facilities
- Oropi Road has no footpaths and no cycle lanes / facilities.

Hollister Lane is identified as a Primary Cycle Route in the TSP, Rowesdale Drive is a Secondary Cycle Route, Pukemapu Road and Oropi Road are not identified as cycle routes in the TSP.

Primary cycle routes make up the city-wide cycle network and would in time be envisaged to have some form of facility to support safe cycling, e.g., protected cycle lanes, off road paths etc. Secondary cycle routes connect cyclists with primary cycle routes and may or may not have dedicated cycling facilities depending on the safety of the route, i.e., traffic volumes and conflicts.

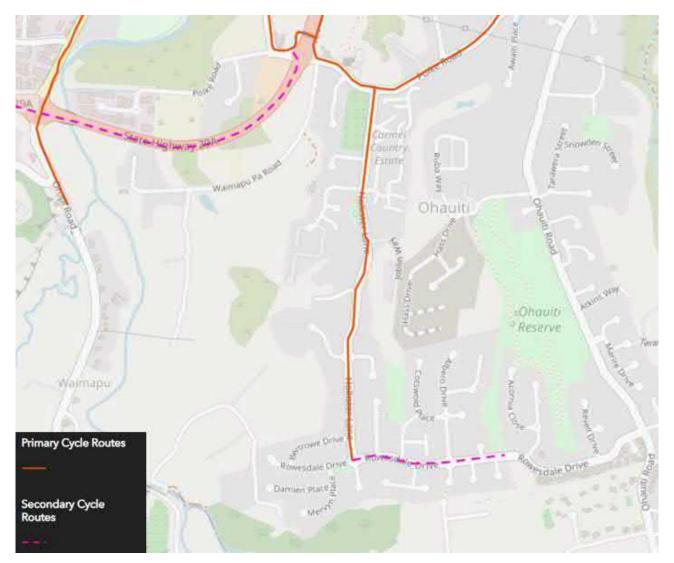

Figure 6: Primary and Secondary Cycle Routes (TSP)

3.4 Public Transport

Public transport services provided within walking distance of the site are as shown below in Figure 7. The only public bus service near the site is route 55. Route 55 operates on Rowesdale Drive and Hollister Lane and provides a connection to Toi Ohomai, Greerton and the Tauranga CBD via Cameron Road.

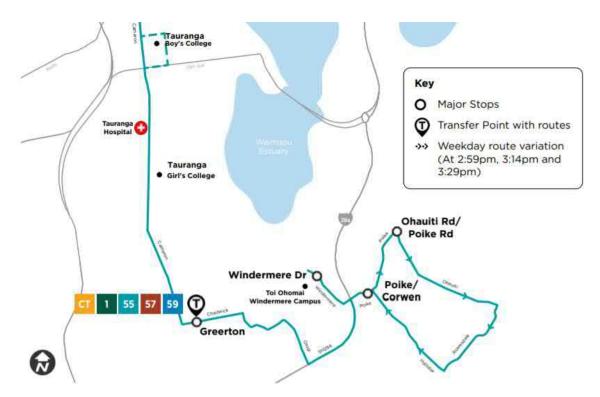

Figure 7: Bay Bus Map Route 55 (baybus.co.nz)

Figure 8: Bus Stops Near the Site

There are bus stops on Oropi Road that are used by students accessing school bus services, but not public bus services.

In the TSP, Primary Bus Routes are routes that connect residential areas with activity centres and major employers served by frequent bus services, e.g., 15-minute headways or less. Secondary bus routes provide public transport network coverage that connects suburbs with the primary public transport routes and with local destinations and services.

Rowesdale Drive is identified as a Secondary Bus Route in the TSP.

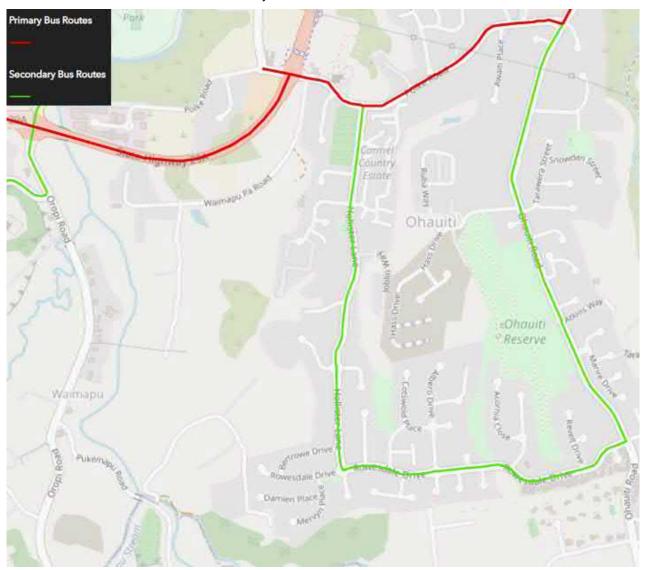

Figure 9: Primary and Secondary Bus Routes (TSP)

3.5 Existing Road Environment

Road Hierarchy

The road hierarchy for the surrounding road network is shown in the following figure. Definitions for these road categories from the TCP are provided below the figure.

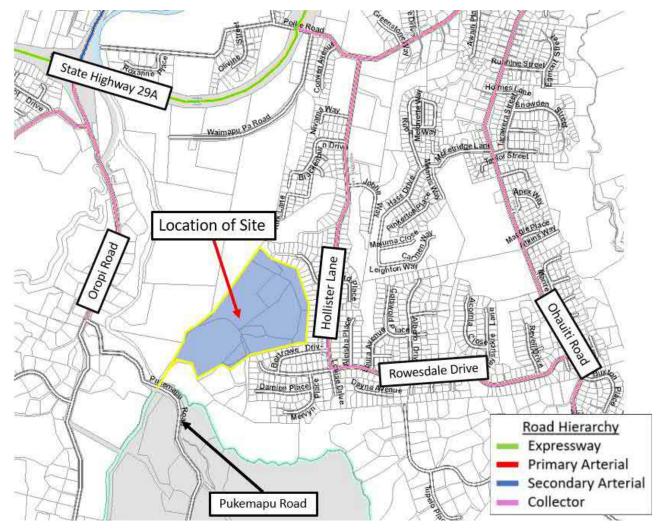

Figure 10: Road Hierarchy

- Expressway: provide for the movement of regional or inter-regional traffic. Access limited to intersecting roads.
- Primary Arterial: Main roads other than motorways and expressways joining significant centres of population and/or providing for regional and inter-regional traffic flow
- Secondary Arterial: Roads joining smaller centres of population and larger centres of population to nearby primary arterials or linking between primary arterials
- Collector: Wider urban roads linking local roads to the arterial network. In rural areas, minor roads linking smaller rural communities to the arterial network. Collector Roads have both a traffic movement function as well as an access role.
- Local: Roads providing direct access for residential and other areas of development in urban areas, with
 more than one intersection to other local or collector roads. Cul-de-sacs are local roads with intersections
 to other local roads at one end only.

3.5.1 Rowesdale Drive

Rowesdale Drive is a local road between the cul-de-sac end and Hollister Lane, and a collector road between Hollister Lane and Ohauiti Road. Rowesdale Drive provides access for residential properties and connects with Hollister Lane and Ohauiti Road.

According to Mobile Road¹ data, Rowesdale Drive carries 1,100 to 1,600 vehicle movements per day between Hollister Lane and Ohauiti Road and around 500 vehicle movements per day on the cul-de-sac section west of Hollister Lane.

Rowesdale Drive is lane marked (section dependent) with one traffic lane in each direction, a general two-way lane width of 10m and a 50kph speed limit. On-street parking is provided, which is unmarked.

Figure 11: Rowesdale Drive Ends as a Cul-De-Sac

3.5.2 Hollister Lane

Hollister Lane is a collector road and connects Rowesdale Drive with State Highway 29A via Poike Road. Hollister Lane has a 10m wide carriageway that accommodates one traffic lane in each direction and unmarked car parking on both sides.

3.5.3 Pukemapu Road

Pukemapu Road is identified as a local road in the TCP and provides access to rural / lifestyle properties. The road is a marked two-laned road with a general two-way lane width of 6m and a 70kph temporary posted speed limit. The road is situated across various sloping terrain and has a short one-way bridge.

According to Mobile Road data Pukemapu Road carries less than 500 vehicles per day with approximately 3% heavy vehicles.

¹ Online traffic count information from local authority RAMM database

Figure 12: Pukemapu Road Bridge and Pukemapu Road facing east from the Oropi Road intersection

3.5.4 Oropi Road

Oropi Road is identified as a collector road in the TCP. Oropi Road connects to Pukemapu Road and provides a connection to State Highway 29A. Oropi Road is a marked two-laned road with a general two-way lane width of 6.4m and a posted speed limit of 80kph.

According to Mobile Road data Oropi Road carries 10,500 vehicles per day with approximately 7% heavy vehicles.

Figure 13: Facing south on Oropi Road

The intersection of Oropi Road and Pukemapu Road is being upgraded by TCC at the time of this report to a roundabout.

3.6 Network Operation

The existing road network experiences congestion particularly at Hollister Lane / Poike Road and State Highway 29A during the weekday morning peak period. With no bus priority in this area, buses are delayed in traffic queues. Oropi Road also experiences delay at the SH29A roundabout during the weekday morning peak.

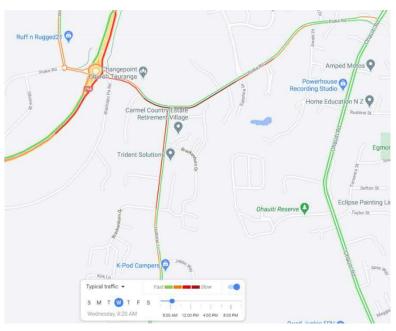

Figure 14: Typical Traffic Speeds During the Weekday Morning Peak at Hollister / Poike / Oropi Road (Google)

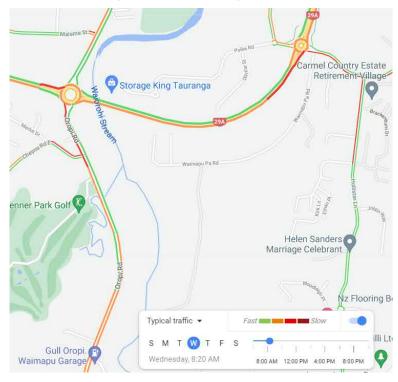

Figure 15: Typical Traffic Speeds During the Weekday Morning Peak at Oropi Road SH29A (Google)

Additional development within the site will generate trips on the road network that, if made by private car during peak periods, will add to existing local traffic congestion. Measures to support local access to opportunities and travel by active modes and public transport will help to mitigate the effect of this. The scale of this effect, and any specific mitigation necessary, would be considered at the resource consent stage. As the site is already zoned residential it is assumed to be developed, and generating trips on the network, within city-wide transport planning studies such as UFTI and the TSP.

3.7 Existing Site Access

3.7.1 Pukemapu Road

The site has a single existing formed accessway via Pukemapu Road as shown in **Figure 16**. The access is shared by the multiple properties within the site. The access is located south of the Pukemapu Road single lane bridge.

Figure 16: Formed Access to Existing Properties within the Site

There is restricted visibility along Pukemapu Road to the south of the existing access. The extent of visibility is approximately 90m as shown in Figure 17. The recommended safe intersection sight distance for a 70km/h speed environment is 150m (Austroads). Actual vehicle speeds approaching the access may be less than 70km/h due to the radius of the corner, but the downhill slope would add to the visibility distance requirement. For a visibility of 90m travel speeds would need to be approximately 50km/h. The existing access is unlikely to achieve Austroads safe sight distance recommendations. Any new or improved access in this location would require the speed limit on Pukemapu Road to be lowered to 50km/h and potentially some earthworks on the opposite side of the road to improve the visibility envelope.

Figure 17: Visibility from the Existing Access Looking South

Figure 18: Visibility Measurement

3.8 Road Safety

Crash data for the past 5 years (2015-2020) has been analysed using the Waka Kotahi (New Zealand Transport Agency) Crash Analysis System (CAS) database for the surrounding road network. The database includes the following crash records within the study area as shown in **Figure 19**.

- 7 crashes in 5 years (2015-2020) which includes:
 - Oropi Road: 1 minor and 5 non-injury crashes
 - Rowesdale Drive: 1 non-injury crash.

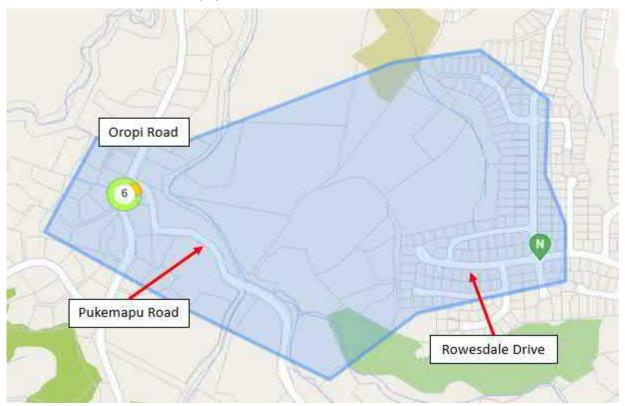

Figure 19: Site Area for Crash Analysis

All six of the crashes on Oropi Road occurred at or near the intersection with Pukemapu Road. The minorinjury crash was the result of a vehicle travelling southbound on Oropi Road colliding with a right turning vehicle from Pukemapu Road on to Oropi Road. Factors involved in the remaining non-injury crashes were generally inappropriate speed or driver behavior which has resulted in collisions with turning vehicles or road features at the intersection. The current upgrade of the Oropi Road / Pukemapu Road intersection to a roundabout may address the crash risk in this location.

The single non-injury crash on Rowesdale Drive occurred from a left-turning vehicle at the Rowesdale Drive / Hollister Lane intersection losing control and striking the median traffic island.

3.9 Trip Generation

At a high level, the Tauranga Transport Model (TTM) applies a vehicle trip generation rate of 7 to 8 vehicle trips per household when predicting vehicle trip generation. This is based on household travel survey, census and traffic count data.

Mode share for non-car modes in Tauranga based on census findings is around 10% walk and cycle and 2% bus. This is a general figure and it will be lower in areas that do not have access to safe and accessible services and facilities for these modes.

Based on this, and as a high-level estimate at this stage, if a development of 200 to 300 dwellings was progressed on the site this would be expected to generate 1,400 to 2,400 vehicle trips per day, around 250-350 walk and cycle trips and around 50-100 bus trips. Typically, around 10% of daily vehicle trips occur during the weekday peak hours (140 to 240 movements).

3.10 Pukemapu Road Bridge

3.10.1 Bridge Capacity

The one lane bridge has a give way arrangement with vehicles travelling southbound (from Oropi Road) giving way to vehicles travelling northbound. The length of the bridge is relatively short (less than 50m). The capacity of the one lane bridge is not considered to present a significant issue with fewer than 500 vehicles per day presently using Pukemapu Road. For comparison, the one lane Pepe Bridge on SH25 in Tairua accommodates around 4,500 vehicles per day (outside peak seasons). The bridge has no facilities (path) for walking or cycling.

3.10.2 Bridge Structural Assessment

An assessment of the structural capacity of the bridge in regard to potentially accommodating additional traffic volumes was undertaken. This assessment concluded that the structure appears to be in good condition overall.

There was nothing observed that would indicate that increased traffic loading on the bridge would compromise its' load carrying capacity.

Based on the existing bridge condition, it is considered unlikely to be feasible to attach a clip-on pedestrian / cycle facility to the bridge deck structure. It may be feasible to span a new footpath structure between the existing piers and abutments with a detailed assessment of the substructure capacity. However, it would likely be more cost effective to build a new independent foot/cycle bridge.

5 Civil Infrastructure Context

A desktop assessment has been undertaken of the existing infrastructure in the surrounding area and a review of the existing landform. Beca has obtained data from TCC Mapi and beforeUdig to inform this assessment.

The existing Rowesdale subdivision is bordered by underground wet services as shown in Figure 19 below. There are dry services present within the existing road corridors.

The site slopes from the existing subdivision down toward Pukemapu Road. Typically, these slopes are steep, ranging between 10%-40%.

The site is bordered by relic slips as well as having some present within the development area, these are shown highlighted in yellow in **Figure 21**.

Figure 20: Existing Services from TCC Mapi

Figure 21: Relic slips from TCC Mapi (highlighted yellow)

Both the existing subdivision and proposed development area have overland flow paths across them. There is a pond and wetland area on the eastern side of the site. Stormwater from the Rowesdale subdivision discharges into the pond, refer to **Figure 22**. Additionally, the stream to the south/west is affected by flooding and harbour inundation (100 year).

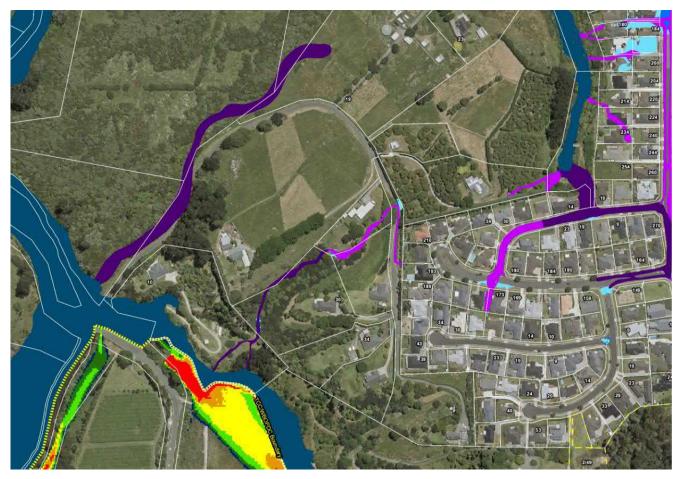

Figure 22: Overland Flow Paths from TCC Mapi

The site access and future land development will need to consider the existing site constraints as part of the development.

6 Long List Option Development

Following a review of the transport and civil environment at and surrounding the site and a site visit, a workshop with Beca and TCC specialists was held to identify all potentially feasible access options.

Figure 23 shows the approximate location of routes considered as potential options for providing access to the site. **Table 1** describes the routes with some initial commentary.

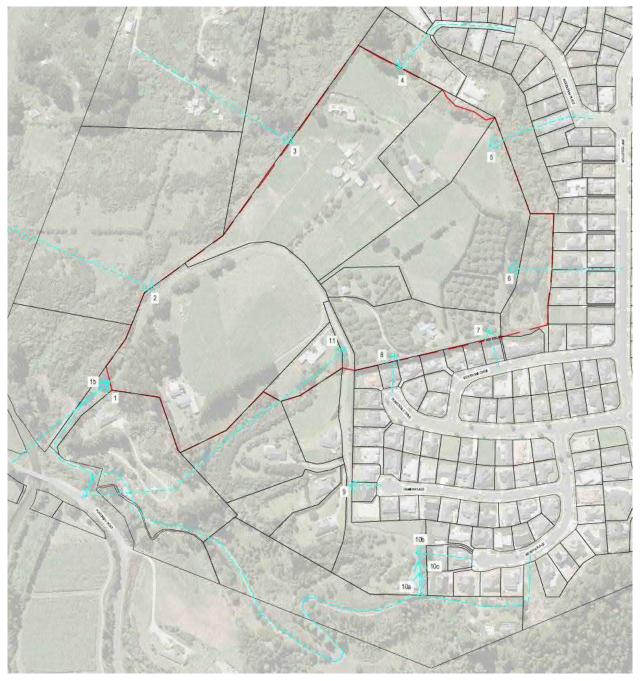

Figure 23: Site Area Plan Showing the Long List of Route Options

Table 1: Long List Routes

No.	Description	Constraints	Comments
1	Existing access from Pukemapu Road	Widening required May cross Maori land	Sight lines a potential issue that may need to be mitigated. Land ownership to be looked into further during design stage if progressed.
1b	New access from Pukemapu Road	New bridge across Waiorohi Stream required. May cross Maori land	Land ownership to be looked into further. Scarp and access to WBOP road to be investigated. Route appears to cross record of title 470347 registered as Maori Freehold Land. Likely whenua associated with Waimapu Marae. Treaty principles should be considered when dealing with this land.
2	New access from Oropi Road	Through 1-2 privately owned lots and Maori land	Crosses record of title 470902 which registered as Maori Freehold Land. Likely whenua associated with Waimapu Marae. Treaty principles should be considered when dealing with this land.
3	Extend existing access from Waimapu Pa Road	Through Maori owned land	This option crosses records of title 444433 and 467755 which are registered as Maori Freehold Land. Likely whenua associated with Waimapu Marae. Treaty principles should be considered when dealing with this land.
4	Extend existing access from end of Woodleigh Place	Will require widening. Through 1+ privately owned lot	This option crosses record of title 156706 which is subject to Land Covenant comprised in in Easement Instrument 6206153.7. This prevents the land being used for 'other than residential purposes' (1.(m)). Additionally, this record of title is subject to a right of way easement (6206153.4). This means if the Council was required to compulsorily acquire land from the current owners for this option, it would also likely need to use its compulsory acquisition powers to acquire the easement rights of the grantee under that easement, adding additional party/ies and complexity to the process.
			Steep gradient. Will affect many properties.

No.	Description	Constraints	Comments
			This option crosses records of title 156716 and 156707 which are subject to Land Covenant comprised in Easement Instrument 6206153.7. This prevents the land being used for 'other than residential purposes' (1.(m)).
5	New access from Woodleigh Place Hollister Lane roundabout	Through 1-2 privately owned lots.	Additionally, this record of title is subject to a right of way easement (6206153.4). This means if the Council was required to compulsorily acquire land from the current owners for this option, it would also likely need to use its compulsory acquisition powers to acquire the easement rights of the grantee under that easement, adding additional party/ies and complexity to the process.
			Steep gradient. Roundabout provides good access at intersection.
6	New access from Hollister Lane	Through 2-4 privately owned lots.	This option crosses records of title 617067, 566554, 414351 and 414352 which are subject to Land Covenant 8146998.6. This prevents the land being used for 'other than residential purposes' (1.(I)). Additionally, this record of title is subject to a right of way easement (8146998.4). This means if the Council was required to compulsorily acquire land from the current owners for this option, it would also likely need to use its compulsory acquisition powers to acquire the easement rights of the grantee under that easement, adding additional party/ies and complexity to the process.
7	New access from Bertrowe Drive	Through 1-2 privately owned lots	May be restricted by stormwater pond. This option crosses record of title 639322 which is subject to Land Covenants in Easement Instrument 8666808.3 - prevents the land being used for 'other than residential purposes' (1.(k)).
8	New access from end of Rowesdale Drive	Through 2 TCC owned properties	Covenant to be investigated.
9	New access from end of Damien Place	Through 2 privately owned lots	This option crosses record of title 688222 which is subject to Land Covenants in Easement Instrument 9075468.9. This prevents the land being used for 'other than residential purposes' (1.(k))
			Steep gradient.

No.	Description	Constraints	Comments
10a	New access from end of Mervyn Place	Through 2 privately owned lots	This record of title is subject to two right of way easements (H519282 and 9075468.8). This means if the Council was required to compulsorily acquire land from the current owners for this option, it would also likely need to use its compulsory acquisition powers to acquire the easement rights of the grantee under that easement, adding additional party/ies and complexity to the process. Steep gradient.
10b	Extend existing access from Pukemapu Road (East)	Through 1-2 privately owned lots	This option crosses records of title 676059 and 664147 which are subject to Land Covenants in Easement Instrument 9075468.9. This prevents the land being used 'for other than residential purposes' (1.(k)). Steep and circuitous route
10c	New access from Mervyn Place	Through 2 privately owned lots	This option crosses record of title 596993 which is subject to Land Covenants contained in Easement Instruments 9715243.1 and 9075468.9. Easement Instrument 9075468.9 prevents the land from being used for 'other than residential purposes' (1.(k)). Additionally, this record of title is subject to a right of way easements (B9075468.7 and 5129999.1). This means if the Council was required to compulsorily acquire land from the current owners for this option, it would also likely need to use its compulsory acquisition powers to acquire the easement rights of the grantee under that easement, adding additional party/ies and complexity to the process. Steep and circuitous route
11	Extend existing access from Pukemapu Road up gully	Through 1 privately owned lot	This record of title is subject to a right of way easements (B388777.12 and 5224533.4). This means if the Council was required to compulsorily acquire land from the current owners for this option, it would also likely need to use its compulsory acquisition powers to acquire the easement rights of the grantee under that easement, adding additional party/ies and complexity to the process. Steep gradients.

7 Scenario Sketches

To inform a multicriteria assessment (MCA) on the long list options, several scenario sketches were developed to show indicatively what an access option could look like if it was developed in the general area of the long list routes, and to define more information on potential associated impacts. Sketches were not developed for all routes individually, as this is not necessary at this stage of the evaluation.

Scenario sketches were developed for general alignments on the following routes:

- Scenario 1: generally applies to long list Routes 4 to 6
- Scenario 2: generally applies to long list Route 7
- Scenario 3: generally applies to long list Route 8
- Scenario 4: generally applies to long list Route 9
- Scenario 5: generally applies to long list Route10
- Scenario 6: generally applies to long list Route 1
- Scenario 7: generally applies to long list Route 11.

Alignment sketches are attached as Appendix A.

7.1 Identified Scenarios

7.1.1 Basis of Scenario Development

The TCC street design tool was used to define the accessway cross-sections in StreetMix as shown below. This resulted in a general arrangement of one traffic lane in each direction for the access road with footpaths and provision for cycling via a shared path on one side. The total road corridor width is 20m.

The TCC street design tool report is provided as Appendix B.

Figure 24: Access Road Typical Cross-Section

7.1.2 Route Scenarios

The seven route scenarios were developed as high-level conceptual designs in Autodesk's Infraworks and high level estimations of the landform changes and infrastructure corridors. A summary of these is shown in **Table 2**. **Table 3** provides a general key for the summary table.

Table 2: Summary of High-Level Concepts

Scenarios	Service Relocation Required.	Earthworks Volumes	Potential Retaining Structure Req.	Properties requiring acquisition for road construction (in whole or in part)	Approximate length of New Road (m)
Scenario 1	Yes	High	Likely	2	Medium
Routes 4,5,6					
Scenario 2	Maybe	Low	No	1	Short
Route 7					
Scenario 3	Maybe	Low +	No	12	Short
Route 8	-				
Scenario 4	Likely	Medium	Likely	3	Medium
Route 9					
Scenario 5	Likely	High ++	Likely	4	Long
Route 10					
Scenario 6	Likely	High +	Likely	1	Long
Route 1					
Scenario 7	Unlikely	High ++	Likely	1	Long
Route 11					

Table 3: Ranges Used for Table 1

Item	High/Long	Med	Low/Short
Earthworks	>5000m ³	1000 – 5000m ³	<1000m ³
Length of access road	>200m	100-200m	<100m

Scenario 1 – Shown as connecting Woodleigh Place to the subdivision via a proposed bridge (long list item 5). This scenario is also applicable to longlist routes 4 to 6. The relocation of existing wet and dry services may be required. Acquisition of two properties (minimum) is required for this scenario to be feasible. Bridge abutments and piers are required, additional retaining structures to support these are likely to be required.

Scenario 2 – Shown as connecting Bertrowe Drive to the new subdivision using fill to build a ramp over the existing embankment. This scenario is applicable to long list route 7 and is not limited to the property it is shown in. The access could be through any property on the north stretch of Bertrowe Drive (extent limited by existing stormwater pond). The relocation of services may be able to be avoided by minimising cut within the property area and having fill within the subdivision zone. Acquisition of one property (minimum) is required for this scenario to be feasible. Existing overland flow path may require a culvert under the access road.

Scenario 3 – Shown as connecting Rowesdale Drive to the subdivision over the existing embankment. This scenario is applicable to long list route 8 and is not limited to the property(ies) it is shown in. The relocation of services may be able to be avoided by minimising cut within the property area and having fill within the subdivision zone. Acquisition of one property (minimum) would be required for this scenario to be feasible, however TCC already own two properties on this route so no additional property purchase would be necessary. Existing overland flow path may require a culvert under the access road.

Scenario 4 – Shown as connecting Damien Place to the subdivision over the existing embankment. This scenario is applicable to long list route 9 and is not limited to the properties it is shown in. The relocation of services may be able to be avoided by minimising cut within the property area and having fill within the subdivision zone however it is likely relocation of wet and dry services will be required. Acquisition of one

² Note TCC own two properties on this route, this figure is within the two properties already owned not additional to.

property (minimum) is required for this scenario to be feasible. Existing overland flow path may require a culvert under the access road. Retaining structures are likely to be required to make this scenario feasible.

Scenario 5 – Shown as connecting Mervyn Place to the subdivision over the existing embankment. This scenario is applicable to long list route 10 and is not limited to the property it is shown in. The relocation of services may be able to be avoided by minimising cut within the property area and having fill within the subdivision zone however it is likely location of wet and dry services will be required. Acquisition of two properties (minimum) is required for this scenario to be feasible. Existing overland flow path may require a culvert under the access road. Retaining structures are likely required to make this scenario feasible.

Scenario 6 – Involves widening of the existing accessway from Pukemapu Road. This scenario is applicable to long list route 1. The relocation of services is unlikely to be required, however there may be private house connection or wet and dry services along this existing access. Acquisition of one property (minimum) is required for this scenario to be feasible due to the cut/fill required.

Scenario 7 – Connects Pukemapu Road to the new subdivision via a new accessway up the existing gully. This scenario is applicable to long list route 11. Acquisition of at least part of one property is required. The relocation of services is unlikely to be required. Overland flow path down the gully/road will be required to be catered for. Retaining structures are likely required to make this scenario feasible.

Long list routes 1b, 2, 3, and 10b, 10c were considered similar to other scenarios. For example, Scenario 1b and 2 can be considered similar to Scenario 1 with the addition of requiring bridges, Long list route 3 would include widening of an existing gravel driveway/private road similar to Scenario 1, Long list routes 10b, 10c can be considered similar to either scenario 5 or 7 in terms or required works.

8 Option Evaluation

8.1 Criteria

8.1.1 Scoring Guidance

The options were evaluated by specialists against the following criteria based on desktop and site visit informed analysis. The draft MCA scoring was then reviewed at a workshop with TCC.

The following criteria was used to evaluate the options in the MCA.

Table 4: MCA Criteria

Network integration – how well does the access integrate with the wider transport network, including for cyclists, pedestrians, PT, private cars and service vehicles. Does the option support future opportunities to integrate across the site?					
Land use integration – how well does the option integrate with surrounding land use, or conflict.					
Safety - how will the access affect the safety of people using the transport network? Does the access promote personal security?					
Directness – does the access enable direct travel options to collector roads and near by opportunities (schools, jobs, recreation etc).					
Geotechnical: High level consideration of known ground conditions, stability					
Constructability: Is the access in such a location or subject to other constraints as to make construction very difficult? Including impact on services and level of disruption during construction					
Three waters: How well does the option support provisions for three waters servicing of the site					
Alignment with IDC: How well does the option align with the TCC Infrastructure Development Code (design standards transportation network)					
Cultural: Is the area in the vicinity of the access a site of cultural, spiritual or other significance?					
Historic Heritage and Archaeology: Are there known historic heritage or archaeological sites in the vicinity of the access?					
Effects on existing community: How will the new access options affect the existing neighbourhood, including character and amenity, and are there other benefits provided to the existing community by forming the access in this location?					
Effects on the new community: How will the new access provide for the new community to be established, including the character and amenity of the newly developed area?					
Land ownership: How many landowners, other than those within the site to be accessed, are directly affected by the option? Count no. landowners required to obtain land directly affected. Count no. landowners to nearest Collector Road (land not required) as indirectly affected.					
Noise: Will adjacent property owners be affected by increased levels of traffic noise?					
Ecology: How will the construction and operation of the access affect animal and plant ecology; loss of habitat, disruption of territorial domains, and interruption of ecological corridors?					

	Impact of the access: Including the footprint of the access, landscape and visual effects on the surrounding area, carbon and resilience impacts.					
Site Acquisition	How difficult will land for the access be to acquire.					
Consentability	How difficult would it be to consent the construction of the proposed access in the chosen location taking into account both Territorial Authority processes (resource consent/designation and contaminated land) and Regional Authority consents (earthworks/ stormwater)?					
Development outcomes	How well does the option support development outcomes, e.g. maximise or impact development yield					

Options were scored against the criteria using a -3 (large negative impact) to +3 (high positive benefit) scale. A slightly different scoring approach was used for civil criteria (construcability, geotech, three waters and development impacts) to better differentiate between options. As described in Table 5.

The civil criteria varied from the overall scoring as the civil works effects are typically all neutral or negative effects. Using a varied scoring allowed separation between the options more clearly showing the impacts within the MCA.

Table 5: Option Scoring for General Criteria and Civil Criteria

	General Criteria	Civil Criteria (Constructability, Geotech, 3-waters, Development)	
Large positive	Major positive impacts resulting in substantial and long-term improvements or enhancements of the existing environment.	Minimal negative impact, possibly only lasting over the short term, and definitely able to be managed or mitigated. May be confined to a small area.	3
Moderate positive	Moderate positive impact, possibly of short-, medium- or long term duration. Positive outcome may be in terms of new opportunities and outcomes of enhancement or improvement.		2
Slight positive	Minimal positive impact, possibly only lasting over the short term. May be confined to a limited area		1
Neutral	Neutral – no discernible or predicted positive or negative impact.	Moderate negative impact. Impacts may be short, medium or long term and are highly likely to respond to management actions.	0
Slight negative	Minimal negative impact, possibly only lasting over the short term, and definitely able to be managed or mitigated. May be confined to a small area.		-1
Moderate negative	Moderate negative impact. Impacts may be short, medium or long term and are highly likely to respond to management actions.		-2
Large negative	Impacts with serious, long-term and possibly irreversible effect leading to serious damage, degradation or deterioration of the physical, economic, cultural or social environment. Required major rescope of concept, design, location and justification, or requires major commitment to extensive management strategies to mitigate the effect.	Large negative impact i.e poor ground conditions, large footprint of land required, large volume of earthworks. Impacts may be short, medium or long term	-3

8.1.2 Sensitivity Test Weighting

Following the MCA assessment, the criteria were weighted to determine whether there are greater benefits to a particular option in relation to social and community values as a sensitivity test.

Sensitivity test weighting differentiates between the short, medium and long-term effects or benefits of the provision of the proposed access. Short and medium term effects are typically less sensitive when considering the overall benefits to the community and social environment. Criteria that have a short term effect such as during construction are weighted at 0.8, criteria that have a long-term effect or benefit such as environmental or amenity effects or the ability to consent the proposed outcome are weighted at 1.5 and criteria that are typically the same across the duration of the development of the area such as the effects on transport of ecology are weighted at 1.0 as the effect is not considered likely to change over time.

In summary social and community weighting considers that scores are multiplied by the following factors:

- 1.5x = strong effect or benefit on social and community values such as character and amenity over a long period of time
- 1.0x = no greater effect or benefit over time than represented by the raw value
- 0.8x = a short term effect on social and community values

For example,

Table 6: Sensitivity Test Weightings

Effect	Weighting
Transport	1.0
Geotechnical and infrastructure	0.8
Social / Cultural	1.5
Noise	1.5
Ecology	1.0
Impact on access	0.8
Site acquisition	0.8
Consentability	1.5
Development outcomes	1.5

8.2 MCA Outcome

The full MCA output spreadsheet is provided in **Appendix C**. The following table summarises the scores for each option against the criteria and the total score.

Routes 10b and 10c shown in Figure 23 were excluded from the analysis prior to the MCA stage as these routes do not connect with the site.

Table 7: Summary MCA Output

Effects	Weighting	Criteria	Option Scoring											
			1	1b	2	3	4	5	6	7	8	9	10a	11
	1	Network integration	0	0	0	-1	1	2	2	1	1	1	1	0
T	1	Land use integration	-1	-1	-1	-3	2	2	2	2	2	2	2	-1
Transport	1	Safety	-2	-1	-1	-2	1	2	2	2	2	2	2	-2
	1	Directness	-1	-1	-1	-3	1	2	3	2	2	1	1	-1
	1	Geotechnical	-1	-2	-2	0	-3	-3	-3	1	2	0	-1	-2
Geotechnical and	1	Constructability	0	-2	-2	-1	-3	-3	-3	1	2	-1	-3	-1
Infrastructure	1	Three waters	1	1	3	1	0	1	1	0	0	0	0	1
	1	Alignment with IDC	-2	-2	-1	-2	-1	3	3	-1	3	-1	3	-2
	1	Cultural	-3	-3	-3	-3	-1	-1	-1	0	0	0	-1	-1
	1	Historic Heritage and Archaeology	-1	-1	-3	1	2	2	2	2	0	-1	-1	-1
Social / Cultural	1	Effects on existing community	2	2	-1	-2	-2	-1	0	-1	-2	-1	-3	-1
	1	Effects on the new community	3	3	0	-1	-1	-1	-1	0	-1	2	2	2
	1	Land ownership	1	1	1	1	-1	1	2	2	3	-2	-2	1
National and	1	Noise	2	2	2	-2	-1	-1	-1	-1	-1	-1	-1	1
Natural and Physical	1	Ecology	-1	-1	-1	-1	-2	-2	-2	-1	-1	-1	-1	-2
Environment	1	Impact of the access	-1	-2	-2	-2	-2	-2	-2	1	1	-1	-2	-2
Site Acquisition	1	Ease	-3	-3	-2	-2	-1	-1	-1	0	3	-1	-2	-1
Consentability	1	RMA	-2	-3	-2	-2	-1	-1	-1	1	1	-1	-1	-1
Development 1 Land use of access with development		3	3	3	3	-1	-1	-1	3	3	3	3	3	
	TOTAL SCORE					-21	-13	-2	1	14	20	0	-4	-10

As can be seen in the table above, options 6, 7 and 8 achieved overall positive scores with option 8 (Rowesdale Drive connection) achieving the highest score of 20. Option 7 was second with a score of 14. Both options 8 and 7 scored positively for transport, land ownership, geotechnical and constructability criteria. Other options had higher risk on geotechnical, cultural, site acquisition and other criteria which impacted the outcome.

Detailed comments on all of the scoring is provided in the MCA table in **Appendix C**.

The sensitivity test did not change the outcome of the MCA, the full sensitivity test table is provided in **Appendix D**.

9 Development of the Highest Ranked Option

Route 8, which was represented by Scenario 3 in the concept sketches, is the preferred option that best achieves the project purpose based on the MCA process.

9.1 Access Road Corridor Design Philosophy

The design philosophy for the access road following Route 8 is to create a 20m wide accessway in accordance with the TCC Street Design Guide.

Within the 20m road corridor we have allowed for a 1.5m footpath on one side and a 3m shared path on the other. It is noted that neither Rowesdale Drive nor Hollister Lane currently have a shared path available, but for costing purposes it has been included in this assessment. This is to support Council's cycle initiatives as Hollister Lane is a Primary Cycle Route.

TCC own two properties at the end of Rowesdale Drive and the design utilises one of these properties fully. At this stage a small area of the second property is required, however the house can potentially remain and could be sold on after construction.

9.2 Design Assumption and Limitations

9.2.1 Roading

The design speed used was 50 km/h. The minimum radius of all horizontal curves is above the absolute minimum required of 49m and is near the desired minimum of 56m for urban roads (Table 7.6 Austroads Guide to Road Design Part 3: Geometric Design).

The maximum vertical slope of the proposed road alignment does not exceed 10% which meets the maximum gradient allowed for in the TCC IDC of 12.5% for local roads. It also meets the standard for roads within 30m of an intersection, not exceeding 10% with a 3% crossfall.

Pavement is assumed to be as per TCC IDC Design Standard DS-4. A departure from the Austroads standards has been identified at a crest vertical curve. The lowest k value of 6.8 meets the minimum value allowed. It does not however meet the appearance criterion minimum value of 33-44. (Tables 8.6 and 8.7 Austroads Guide to Road Design – Part 3: Geometric Design). This is considered acceptable for the expected volume and speed.

9.2.2 Services

It is assumed the eventual developer's design for the stormwater and wastewater systems within the site will accommodate the catchment upstream of the development. No allowance has been made in the concept design for stormwater analysis, including pre and post development assessments or quantity and quality analysis. No dry service providers have been approached and it is assumed there is adequate capacity for new dry service connections in existing systems.

A new water main connection to Ohauiti Road is proposed to meet the requirements of Table 7.3 in DS-7 of the TCC IDC for a 200mm watermain connection.

A new wastewater connection to an existing pump station is assumed to be part of the new development. An easement may be required at the northern end of the site, to connect the proposed sanitary sewer pipeline to the existing pump station.

9.3 Concept Design

The concept design is shown below in **Figure 25** and **Figure 26**. Refer **Appendix E** for full concept design drawings.

Figure 25: Concept Design - Plan

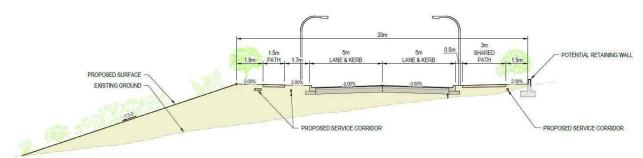

Figure 26: Concept Design Cross-section

9.4 Concept Design Cost Estimate

The purpose of this cost estimate is to provide a Concept Design Cost estimate of quantifiable items (+/-50) for the construction works given the level of detail available. Some provisional, contingency and design development allowances have been included for non-quantifiable items. Further site investigations will need to be undertaken to refine the likelihood and potential impact. Generally, the cost of the projects is comparable for project of similar scale.

Specific reference should be made to the fact that the cost estimate should not be relied upon as absolute/final or be used for funding applications as other costs need to be included for a complete cost estimate, refer to the exclusions and assumption sections for some of these costs.

9.4.1 Summary of Concept Design Cost Estimate

The table below summarizes the cost estimates for the construction of the access route. A breakdown for preliminary and general costs and project related costs can be provided.

Refer 9.4.2 (a) for the methodology used to prepare the cost estimate.

The cost estimate has been derived at a range of -50% to +50%.

Table 8: Cost Estimate Summary Schedule

Costing Category	Cost Estimate (\$NZD)
Preliminary & General	\$ 45,000.00
Environmental Compliance	\$ 21,200.00
Traffic Management and Temporary Works	\$ 21,000.00
Earthworks	\$ 792,762.00
Drainage	\$ 212,900.00
Kerbs & Concrete Work	\$ 152,350.00
Pavement Marking	\$ 5,000.00
Signage	\$ 5,000.00
Street Lighting	\$ 14,000.00
Landscaping	\$ 50,800.00
Fencing	\$ 18,000.00
Utility Services	\$ 508,000.00
Provisional Sums & Dayworks	\$ 133,800.00
Professional Services	\$ 296,980.00
(15% of Construction Costs)	
Construction Contingency and Design Development	\$ 569,200.00
(25% of Construction and Professional Services Costs)	
Consenting costs (including Archaeological Authority)	Excluded
SUB TOTAL (excl. GST)	\$ 2,846,000.00

The estimate excludes TCC costs such as project management and property (cost or sale income)

9.4.2 Scope of Concept Design Estimate

Item Description a) Measurement is generally in accordance with NZS 4224:1983 "Code of Practice for Measurement of Civil Engineering Quantities". The rates have been prepared using a combination of first principle assessments, using our database of previous / current rates / projects for the key scope items identified. The prices and rates entered in this Schedule are generally deemed to have been allowed for all costs involved in supplying, placing and/or fixing and testing each item in its final position or form unless noted otherwise. This estimate has also been priced on local construction industry rates at present-date prices (June 2021). The assessment is for the sole purpose to inform the client of an estimated cost of construction. Reference documents Civil Design Drawings dated 11 June: 4289820-CA-001, Ohauiti Site Access Assessment, Existing Services, Layout Plan, Rev A 4289820-CA-002, Ohauiti Site Access Assessment, Proposed Services, Layout Plan, Rev 0 4289820-CA-003, Ohauiti Site Access Assessment, Proposed Accessway, Plan and Long Section, Rev A 4289820-CA-004, Ohauiti Site Access Assessment, Proposed Accessway, Cross Sections, Rev A Specific reference should be made to the fact that the cost estimate should not be relied upon as absolute/final or be used for funding application as other costs need to be included for a complete cost estimate, refer excludes and assumption sections for some of these costs.

b) The scope is limited to the cost expected during the design construction contract. This cost estimate is limited to the following site-specific requirements: · Contractors Construction including: Preliminary & General • Environmental Compliance • Traffic Management and Temporary Works Earthworks Drainage Kerbs & Concrete Work **Pavement Marking** Signage • Traffic Signals Street Lighting **Utility Services** Landscaping c) Main Contractor Preliminary & General Items (P&G), otherwise known as On-Site / Off-site Overhead costs covers items such as: • Site supervision / management, site offices, stores, plant, cranes, administrative, financial, executive and plant costs d) Construction Contingency is a risk contingency to cover the cost of variation claims made by the contractor during the construction phase of the project. We have allowed for 15% contingency. The Design Development Allowance is a general allowance for residual cost risk including design development, omissions, sundry unmeasured items and considerations made for construction details omitted from the current project scope. We have allowed for 10%. e) This cost estimate is based on the design information provided and is currently subject to an accuracy range of -50% to +50%, as the estimation is highly sensitive to the survey information available, the existing service, and traffic management requirements.

9.4.3 Assumptions

The level of accuracy in the cost estimate has been derived at a range of -50% to +50%.

Item	Description
a)	Key assumptions used in this cost-estimate are outlined below:
	 Indications of boundaries, areas and volumes used in the cost estimate are dependent on the quality information and aerial photography available of Tauranga City Council Mapi system and LINZ. Greater accuracy may be achieved from a topographical survey of site in proceeding design or construction stages.
	 That the existing on-site material is suitable for compacted cut to fill earthworks. Additional imported material will also be required to bring the site to formation level. Portion of the stripped topsoil will be used for grassed and landscaping areas, with the remainder being carted offsite.
	A nominal allowance for ground improvement is included
	 Provisional sum included for upgrade/renew of adjoining public service networks (water connection and wastewater pump station). It is assumed that there is adequate capacity in the existing infrastructure for the new connections.
	The contract will be procured by TCC in accordance with NZS3910
	 Construction Period is 100 Working Days, will commence 2022 and coincide with the development work.

- b) General assumptions used in this cost-estimate are outlined below:
 - There is unrestricted access to undertake the works
 - Works will be carried out by a single main contractor. No allowance has been made for multiple contractors. The works will coincide the development of the subdivision by the same contractor.
 - All roads to remain open during construction.
 - Allowance for inclement weather will need to be included in the construction programme within the construction plan
 - Material from local quarry is suitable as import fill and pavement material.
- c) Site-specific risks that impact the level of accuracy include the following items:
 - Disposal of contaminated land or building materials
 - Archaeological discoveries may halt or slow project works
 - Disruption to allow connections to existing council services may incur unforeseen delays and cost
 - Unidentified underground services
 - Assumes that the Contractor is a qualified competent Contractor (minimum Level C Waka Kotahi Prequalification level)
 - Contaminated land and removal of such soils to a managed landfill
 - Further input from geotechnical investigation will direct earthworks levels in future design stages.

9.4.4 Exclusions

There are general and site-specific risks to the cost estimate that will need to be evaluated in preparing the overall cost estimate. These could have a significant impact on the out-turn cost.

Exclusions for the Estimate:

- Cost of consents and Archaeological Authority
- Public Consultation
- Accidental discovery of artefacts
- · Disposal of contaminated soil or asbestos off-site
- Betterment of existing services
- · Renewals of services and roading infrastructure
- Excavation of rock
- Carbon credits
- · Significant ground improvements i.e. piles, deep soil mixing
- Land acquisition and easement costs (if required)
- Other professional services, such as cost to prepare and attend hearings if required
- Future maintenance and operational costs
- Project funding costs
- Client management costs
- Escalation
- Legal and finance costs
- Goods & Services Tax (GST)
- A nominal allowance has been included for the design works and construction monitoring, but does not include stand-down or standby allowance
- Covid-19 related costs
- Cost allowance to relocate unidentified services
- Cost allowance for liaising with existing service providers of dry services. Provisional item included for relocating only. Services connections for new development not included.
- Vibration damage
- Full road closures and diversions for long duration traffic management.

9.4.5 Limitations

These clauses have been written in conjunction with and are intended to be reviewed alongside the Engineers Estimates.

Description

© Beca 2021 (unless Beca has expressly agreed otherwise with the Client in writing).

This report has been prepared by Beca on the specific instructions of our Client. It is solely for our Client's use for the purpose for which it is intended in accordance with the agreed scope of work. Any use or reliance by any person contrary to the above, to which Beca has not given its prior written consent, is at that person's own risk.

Where another party has supplied information for use in this report, it is assumed to be reliable. Beca reserves the right, but not the obligation, to review all calculations included or referred to in this report and, if considered necessary, to revise its opinion in the light of any new or existing information.

This cost estimate has been developed solely for the purpose of a Concept Design cost estimate of physical works. They cannot be used for budget-setting purposes as the design is not detailed enough and required items may have been omitted and/or the works not fully scoped.

10 Consenting

Route 8 is likely to require further investigation and/or the following Regional and Territorial Authority resource consents, and it is recommended that an Archaeological Authority to modify or destroy unknown archaeological sites is also obtained from Heritage New Zealand.

- Tauranga City Plan: "The construction and vesting of infrastructure in the Council that complies with the relevant performance standards in Appendix 12A, B, C, D and E is a Controlled activity", (Table 12G.1, TCP)
- National Environmental Standard for Assessing and Managing Contaminants in Soil to Protect
 Human Health (NESCS). Further investigation required. As this area is, or has been, used for
 horticulture then a Preliminary Site Investigation would need to be carried out to determine whether a
 Detailed Site Investigation is needed, which will then determine whether further resource consents
 under the NESCS or the Bay of Plenty Regional Natural Resources Plan (RNRP) are required.

It is noted that the expected earthworks volumes for construction of this scenario do not trigger the need for consent under the RNRP.

11 Conclusion

TCC's purpose of this work is to provide a sufficient road access and services route to enable residential development of the underdeveloped residential zoned land.

This technical assessment has:

- identified all reasonably practicable options
- assessed the advantages and disadvantages of the options
- · recommend a preferential option for more detailed assessment / consideration
- provided a concept design and indicative cost estimate for the preferred option to inform further assessment / consideration.

The assessment has considered a wide range of options and criteria and the preferential option clearly demonstrates greater benefit and lower impacts than the alternative options.

Detailed design, consultation and consenting will need to be completed as next steps if TCC decide to advance with the preferred option as the way forward.

Located within or adjacent to stormwater soakage decommissioning zone: No	Not Applicable	Not Applicable	Not Applicable

Cycling elements

	1	×	×	×	х
Indicators	Combined pedestrian and cycle path	Cyclists sharing the carriageway	Marked cycle lane	Protected or buffered cycle lane	Cycle path provided outside of the street corridor
Road classification: Local road (through route)	Not Applicable	Mandatory unless criteria met	Acceptable and preferred	Acceptable and preferred	Acceptable and preferred
"Anticipated" traffic volumes (per day): 1000-5000	Not Applicable	Acceptable but not preferred	Acceptable and preferred	Mandatory unless criteria met	Not Applicable
Buses per hour: 1-6	Not Applicable	Prohibited unless criteria met	Acceptable and preferred	Mandatory unless criteria met	Not Applicable
On cycle plan or planned key cycle route: Yes	Prohibited unless criteria met	Not Applicable	Acceptable and preferred	Mandatory unless criteria met	Acceptable and preferred
Overland flow path: Minor	Not Applicable	Not Applicable	Not Applicable	Not Applicable	Not Applicable
Located within or adjacent to stormwater soakage decommissioning zone: No	Not Applicable	Not Applicable	Not Applicable	Not Applicable	Not Applicable

Cycling elements justification

Element selected/not selected	Indicator	Justification	
Combined pedestrian and cycle path	On cycle plan or planned key cycle route: Yes	 Where it is the safest option for cyclists and pedestrian movement to occur due to physical limitation conflicts in the width of a street, and where faster cyclist speeds (above 15kph) can be discouraged through signposting or calming measures. Where the path would be used by recreational or inexperienced cyclists only and at a slow speed (for example near schools and childcare centres). 	
Cyclists sharing the carriageway	Road classification: Local road (through route)	Where a cycle lane is provided instead.	
Protected or buffered cycle lane	Buses per hour: 1-6	A marked or off-road cycle lane is provided instead.	
Protected or buffered cycle lane	On cycle plan or planned key cycle route: Yes	A marked or off-road cycle lane is provided instead.	
Protected or buffered cycle lane	"Anticipated" traffic volumes (per day): 1000-5000	A marked or off-road cycle lane is provided instead.	

Bus elements

	✓	×	
Indicators	Bus stop with shelter	Simple bus stop	
Road classification: Local road (through route)	Not Applicable	Not Applicable	
"Anticipated" traffic volumes (per day): 1000-5000	Not Applicable	Not Applicable	
Buses per hour: 1-6	Mandatory unless criteria met	Acceptable and preferred	
On cycle plan or planned key cycle route: Yes	Not Applicable	Not Applicable	
Overland flow path: Minor	Not Applicable	Not Applicable	
Located within or adjacent to stormwater soakage decommissioning zone: No	Not Applicable	Not Applicable	

Traffic calming elements

	✓
Indicators	Traffic calming
Road classification: Local road (through route)	Mandatory unless criteria met
"Anticipated" traffic volumes (per day): 1000-5000	Acceptable and preferred
Buses per hour: 1-6	Acceptable but not preferred
On cycle plan or planned key cycle route: Yes	Mandatory unless criteria met
Overland flow path: Minor	Not Applicable
Located within or adjacent to stormwater soakage decommissioning zone: No	Not Applicable

Place element selection

Parking and loading elements

	×	1	х	х	х	х	/
Indicators	Formal car parks	Informal car parks	Accessible parking		Charging for electric vehicles	Formal loading space	Layout of vehicle crossings
•	Mandatory unless criteria met	Prohibited unless criteria met	Mandatory unless criteria met	Mandatory unless criteria met	Acceptable and preferred	Acceptable and preferred	Mandatory

Parking and loading elements justification

Element selected/not selected	Indicator	Justification
Formal car parks	Residential: Medium density character/retirement (15-25dph)	Where no car parking is provided due to all public parking needs being met on private property.
Informal car parks	Residential: Medium density character/retirement (15-25dph)	Where an existing street corridor does not have enough space or an incompatible layout for formalised car parking bays. AND; Where expected parking demand is very low (less than 5 vehicles parked during peak hours). AND; Where providing informal parking opportunities would not likely result in vehicles parked on berms, footpaths or other areas due to physical constraints.
Accessible parking	Residential: Medium density character/retirement (15-25dph)	If the street is on a very steep gradient (steeper than 1:10).
Bicycle parking facility	Residential: Medium density character/retirement (15-25dph)	Where bicycle parking is provided within private property or other reserve (for example a garage or apartment complex or park).

Walking elements

	х	х	×
Indicators	Special footpath surfaces	Pedestrian crossing	Shelter for pedestrians
Residential: Medium density character/retirement (15-25dph)	Acceptable but not preferred	Mandatory unless criteria met	Prohibited unless criteria met

Walking elements justification

Element selected/not selected	Indicator	Justification
Pedestrian crossing	Residential: Medium density character/retirement (15-25dph)	Local road

Soft landscape elements

	1	х	х	х	×
Indicators	Street trees	Planting at intersections	Planting in berms	Planting within roundabouts	Planting within central medians
Road classification: Local road (through route)	Not Applicable	Prohibited unless criteria met			
Residential: Medium density character/retirement (15-25dph)	Mandatory unless criteria met	Not Applicable	Not Applicable	Not Applicable	Not Applicable

Hard landscape elements

	х	Х	1	х	×
Indicators	Public drinking fountains	Public seating	Street furniture zone		Space for public artworks or sculptures or other cultural installation
Road classification: Local road (through route)	Not Applicable	Not Applicable	Not Applicable	Not Applicable	Not Applicable
Residential: Medium density character/retirement (15-25dph)	Prohibited unless criteria met	Acceptable and preferred	Mandatory unless criteria met	Prohibited unless criteria met	Acceptable but not preferred

Resource recovery and waste elements

	✓	×	
Indicators	Refuse collection points	Public rubbish bins	
Residential: Medium density character/retirement (15-25dph)	Mandatory unless criteria met	Acceptable but not preferred	

Legibility elements

	✓	×
Indicators	Street naming to reflect cultural context	Special signage and wayfinding elements
Residential: Medium density character/retirement (15-25dph)	Acceptable and preferred	Acceptable but not preferred

Utility selection

Utility owned power

Location	Selected	Desirability	Use restrictions
Grass berm with other linear utilities.	1	Acceptable and preferred	None
Planted berm with other linear utilities.	Х	Allowed with justification	In discussion and with written approval from TCC Parks and Recreation team and utility provider (including plant type). Planting not allowed that will impede access to and opening of the transformers and switch units. Will not impact on operating the equipment and will allow for safe egress in a fault situation e.g. switch failure/flashover.
Hard surfaced berm (including footpath or off- road cycle path).	×	Allowed with justification	In discussion and with written approval from utility provider. Restrictions on surface type – only plain concrete (with frequent expansion joints), bitumen or pavers unless overlay triggers "special footpath surfaces".
Indented car parking.	Х	Allowed with justification	In discussion and with written approval from utility provider. For high density developments consider future connections and maintenance requirements. Provide details/locations to utility provider for consideration during design. Utility may require ducting and spare ducts may be required.
Grass/planted berm, central median and roundabouts without linear utilities.	Х	Not applicable	None
Carriageway (including carriageway parking, cycle lanes and shared zones).	×	Prohibited	None
Raingarden.	×	Prohibited	None
Swale.	Х	Allowed with justification	In discussion and with written approval from utility provider. Depends on the location of the swale, not allowed in a central median swale.
Turning area in shared zone.	×	Not applicable	None
On one side of the road only.	×	Allowed with justification	In discussion and with written approval from utility provider. May be allowed where no more than two road crossings are required and the development cannot be extended in the future.
Public Parks and Reserves.	х	Allowed with justification	In discussion and with written approval from TCC's Spaces and Places team even though this is the preferred option by the utility. An easement will be required.
Private property.	Х	Prohibited	None

Location	Selected	Desirability	Use restrictions
Within zone of influence of retaining walls as defined in T1012 (under development).	×	Allowed with justification	In discussion and with written approval from utility provider.

Utility owned communication

Othity Owned Commu								
Location	Selected	Desirability	Use restrictions					
Grass berm with other linear utilities.	1	Acceptable and preferred	None					
Planted berm with other linear utilities.	×	Allowed with justification	In discussion and with written approval from TCC Parks and Recreation team.					
Hard surfaced berm (including footpath or off- road cycle path).	×	Allowed with justification	In discussion and with written approval from utility provider. Restrictions on surface type – only plain concrete (with frequent expansion joints), bitumen or pavers unless overlay triggers "special footpath surfaces".					
Indented car parking.	х	Allowed with justification	No parking at customer connection points. Intermittent 2x2m grass spaces available. For high density developments consider future connections and maintenance requirements. In discussion and with written approval from the utility provider for low density developments.					
Grass/planted berm, central median and roundabouts without linear utilities.	Х	Not Applicable	None					
Carriageway (including carriageway parking, cycle lanes and shared zones).	×	Prohibited	None					
Raingarden.	×	Prohibited	None					
Swale.	×	Prohibited	None					
Turning area in shared zone.	X	Not Applicable	None					
On one side of the road only.	х	Allowed with justification	Network deployment down one side of the road requires frequent road crossings to reach every lot/unit, this deployment is only appropriate when the total length of network (including road crossings) is significantly less then total length of network if it was deployed down both sides of the road.					
Public Parks and Reserves.	х	Allowed with justification	In discussion and with written approval from TCC's Spaces and Places team. An easement will be required.					
Private property.	×	Prohibited	None					
Within zone of influence of retaining walls as defined in T1012 (under development).	Х	Allowed with justification	In discussion and with written approval from utility provider.					

Utility owned gas

Location	Selected	Desirability	Use restrictions					
Grass berm with other linear utilities.	1	Acceptable and preferred	None					
Planted berm with other linear utilities.	×	Allowed with justification	In discussion and with written approval from TCC Parks and Recreation and utility provider.					
Hard surfaced berm (including footpath or off-road cycle path).	×	Allowed with justification	In discussion and with written approval from utility provider. Restrictions on surface type – only plain concrete (with frequent expansion joints), bitumen or pavers unless overlay triggers "special footpath surfaces".					
Indented car parking.	X	Allowed with justification	In discussion and with written approval from utility provider. For high density developments consider future connections and maintenance requirements.					
Grass/planted berm, central median and roundabouts without linear utilities.	х	Not Applicable	None					
Carriageway (including carriageway parking, cycle lanes and shared zones).	X	Prohibited	None					
Raingarden.	×	Prohibited	None					
Swale.	X	Prohibited	None					
Turning area in shared zone.	×	Not Applicable	None					
On one side of the road only.	×	Allowed with justification	In discussion and with written approval from utility provider. May be allowed where no more than two road crossings are required and the development cannot be extended in the future.					
Public Parks and Reserves.	×	Allowed with justification	In discussion and with written approval from TCC's Spaces and Places team. An easement will be required.					
Private property.	Х	Prohibited	None					
Within zone of influence of retaining walls as defined in T1012 (under development).	×	Allowed with justification	In discussion and with written approval from utility provider.					

Utility owned water reticulation

Location	Selected	Desirability	Use restrictions
Grass berm with other linear utilities.	✓	Acceptable and preferred	None
Planted berm with other linear utilities.	×	Allowed with justification	In discussion and with written approval from TCC Parks and Recreation team.
Hard surfaced berm (including footpath or off-road cycle path).	×	Allowed with justification	In discussion and with written approval from utility provider. Restrictions on surface type – only plain concrete (with frequent expansion joints), bitumen or pavers unless overlay triggers "special footpath surfaces".
Indented car parking.	×	Prohibited	None
Grass/planted berm, central median and roundabouts without linear utilities.	Х	Not Applicable	None
Carriageway (including carriageway parking, cycle lanes and shared zones).	×	Prohibited	None
Raingarden.	×	Prohibited	None
Swale.		Prohibited	None
Turning area in shared zone.	×	Not Applicable	None
On one side of the road only.	Х	Prohibited	None
Public Parks and Reserves.	×	Allowed with justification	In discussion and with written approval from TCC's Spaces and Places team. An easement will be required.
Private property.	×	Prohibited	None
Within zone of influence of retaining walls as defined in T1012 (under development).	×	Allowed with justification	Specific engineering design required to enable ongoing maintenance and renewal and to protect wall against pipe burst.

No bulk water utility

Subdivision fed off of rider main

Utility owned streetlights

Utility owned streeting	Jiilo								
Location	Selected	Desirability	Use restrictions						
Grass berm with other linear utilities.	×	Allowed with justification	Circumstance where this may be allowed: Adequate separation distances provided.						
Planted berm with other linear utilities.	×	Allowed with justification	In discussion and with written approval from TCC Parks and Recreation team. Circumstance where this may be allowed: Adequate separation distances provided between streetlight and utility.						
Hard surfaced berm (including footpath or off-road cycle path).	Х	Allowed with justification	Circumstance where this may be allowed: Adequate footpath width around streetlight.						
Indented car parking.	×	Allowed with justification	Circumstance where this may be allowed: A vehicle manoeuvring assessment will be provided. The clearance envelope between vehicle body and light columns are a minimum of 600mm.						
Grass/planted berm, central median and roundabouts without linear utilities.	Х	Acceptable and preferred	None						
Carriageway (including carriageway parking, cycle lanes and shared zones).	×	Prohibited	None						
Raingarden.	×	Allowed with justification	Circumstance where this may be allowed : Special corrosion protection and foundation design required.						
Swale.	×	Allowed with justification	Circumstance where this may be allowed : Special corrosion protection and foundation design required.						
Turning area in shared zone.	X	Not Applicable	None						
On one side of the road only.	1	Acceptable and preferred	None						
Public Parks and Reserves.	X	Not Applicable	None						
Private property.	Х	Prohibited	None						
Within zone of influence of retaining walls as defined in T1012 (under development).	Х	Allowed with justification	In discussion and with written approval from Power utility provider.						

Utility owned stormwater

Location	Selected	Desirability	Use restrictions
Grass berm with other linear utilities.	Х	Acceptable and preferred	None
Planted berm with other linear utilities.	×	Allowed with justification	In discussion and with written approval from TCC Parks and Recreation team.
Hard surfaced berm (including footpath or off-road cycle path).	х	Acceptable and preferred	None
Indented car parking.	×	Allowed with justification	Circumstance where this may be allowed: There are no trees in this corridor.
Grass/planted berm, central median and roundabouts without linear utilities.	Х	Not Applicable	None
Carriageway (including carriageway parking, cycle lanes and shared zones).	✓	Acceptable and preferred	None
Raingarden.	×	Acceptable but not preferred	None
Swale.	×	Acceptable but not preferred	None
Turning area in shared zone.	×	Not Applicable	None
On one side of the road only.	X	Acceptable and preferred	None
Public Parks and Reserves.	X	Allowed with justification	In discussion and with written approval from TCC's Spaces and Places team even though this is the preferred option by the utility. An easement will be required.
Private property.	×	Allowed with justification	Circumstance where this may be allowed: Access will be provided. Easements required.
Within zone of influence of retaining walls as defined in T1012 (under development).	X	Prohibited	None

Utility owned wastewater reticulation

Location	Selected	Desirability	Use restrictions					
Grass berm with other linear utilities.	√	Acceptable and preferred	None					
Planted berm with other linear utilities.	×	Allowed with justification	In discussion and with written approval from TCC Parks and Recreation team.					
Hard surfaced berm (including footpath or off-road cycle path).	Х	Acceptable and preferred	None					
Indented car parking.	×	Allowed with justification	Circumstance where this may be allowed: There are no trees in this corridor.					
Grass/planted berm, central median and roundabouts without linear utilities.	Х	Not Applicable	None					
Carriageway (including carriageway parking, cycle lanes and shared zones).	×	Acceptable and preferred	None					
Raingarden.	×	Prohibited	None					
Swale.	×	Prohibited	None					
Turning area in shared zone.	Х	Not Applicable	None					
On one side of the road only.	Х	Acceptable and preferred	None					
Public Parks and Reserves.	х	Allowed with justification	In discussion and with written approval from TCC's Spaces and Places team even though this is the preferred option by the utility. An easement will be required.					
Private property.	×	Allowed with justification	Circumstance where this may be allowed: Access will be provided. Easements required.					
Within zone of influence of retaining walls as defined in T1012 (under development).	Х	Prohibited	None					

Council owned street trees

Location	Selected	Desirability	Use restrictions
Grass berm with other linear utilities.	×	Prohibited	None
Planted berm with other linear utilities.	Х	Prohibited	None
Hard surfaced berm (including footpath or off-road cycle path).	×	Allowed with justification	Circumstance where this may be allowed: Adequate footpath width around tree.
Indented car parking.	X	Allowed with justification	Circumstance where this may be allowed: Adequate berm width available and adequate clearance from car parking. Appropriate tree species will be selected.
Grass/planted berm, central median and roundabouts without linear utilities.	√	Acceptable and preferred	None
Carriageway (including carriageway parking, cycle lanes and shared zones).	×	Allowed with justification	Circumstance where this may be allowed: Tree pits provided in parking lane.
Raingarden.	×	Prohibited	None
Swale.	×	Allowed with justification	Circumstance where this may be allowed: Adequate capacity in swale remains.
Turning area in shared zone.	Х	Not Applicable	None
On one side of the road only.	X	Acceptable but not preferred	None
Public Parks and Reserves.	Х	Not Applicable	None
Private property.	Х	Not Applicable	None
Within zone of influence of retaining walls as defined in T1012 (under development).	Х	Allowed with justification	The tree is located below the wall only and specific design required to ensure the tree will not affect the retaining wall.

Element/utility selection summary

Link elements

Movement lane elements

• One lane in each direction, with centreline

Driving elements

• Wider lane for truck or bus (overwidth lane)

Walking elements

• Footpath on both sides of the street

Cycling elements

· Combined pedestrian and cycle path

Bus elements

• Bus stop with shelter

Traffic calming elements

• Traffic calming

Vehicle design speed

• 50km/h

Stormwater elements

• Overland flow path along kerb and channel

Place elements

Parking and loading elements

- Informal car parks
- · Layout of vehicle crossings

Walking elements (no selected elements)

Soft landscape elements

· Street trees

Hard landscape elements

• Street furniture zone

Resource recovery and waste elements

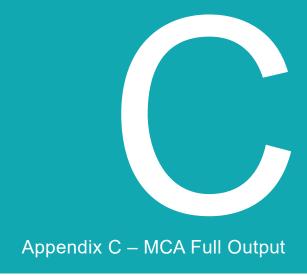

• Refuse collection points

Legibility elements

• Street naming to reflect cultural context

Utilities

- Utility owned power
 Utility owned communication
 Utility owned gas
 Utility owned water reticulation
 No bulk water utility
 Utility owned streetlights
 Utility owned stormwater
 Utility owned wastewater reticulation
 Council owned street trees
- Council owned street trees

Multi-Criteria Analysis Project name: 4289820 - Ohauli Ste Access Assessment | Problem/opportunity statement: | Existing residential zoned land without suitable access. Effects	Criteria	Scoring Impacts	Comments	E Comments	Comments	Comments	E Comments	E Comments	E Comments	E Comments	E Comments	E Comments	Comments	E Comments E S
	Network integration – how well does the access integrate with the wider transport network, including for cyclists, pedestrians, PT private cars and service vehicles. Does the cytion support future opportunities to integrate across the site?	:	Option 1 Indirect route to Collector Road. No PT routes. Would require pedicycle facility to Oropi Rd and wider connections. Some benefit in cross site connectivity	Option 1b Indirect route to Collector Road. No PT routes. Would require pedicycle facility to Crop IR and wider connections. Some benefit in cross site connectivity	Option 2 Indirect route to Collector Road. No PT routes. Would require ped/cycle facility to Oropi Rd and wider connections. Some benefit in cross site connectivity	Option 3 Very long route to Collector Road. No PT routes. Would require dedicated pedicycle facility to Polike Rd and wider connections. No cross connection benefit	Routes to collector road via narrow accessway. Difficult to provide pedicycle connection. Impact on congestion at Polike Rd	Option 5 Direct route to collector road with PT access. Able to provide pedicycle facility. Supports future cross connection. Impact on congestion at Polike Rd	Option 6 Direct route to collector road with PT access. Able to provide ped/cycle facility. Supports future cross connection. Impact on congestion at Polike Rd	Option 7 Direct route to collector road with PT access however uses narrow local road. Able to provide pedicycle facility. Supports future cross connection. Impact on congestion at Poike Rd	Routes to collector road via short local road section, with PT access. Able to provide pedicycle facility. Supports future cross connection. Impact on congestion at Poike Rd	Option 9 Indirect route to collector road with PT access. Assume ped cycle path can be provided. Does not support direct cross site connectivity.	Option 10s Indirect route to collector road with PT access. Assume ped cycle path can be provided. Does not support direct cross site connectivity.	Option 11 Indirect route to Collector Road. Would require ped/cycle facility to Oropi Rd and wider connections. Some benefit in cross site connectivity
Transport	Land use integration – how well does the option integrate with surrounding land use, or conflict.	Options with fewer impacts / effects on network function, cycle, pedestrian, PT access, integration, safety and directness score higher than those with a	Conflicts with general rural nature of Pukemapu Rd. Oropi Rd becomes more urban	Conflicts with general rural nature of Pukemapu Rd. Oropi Rd becomes more urban	Conflicts with rural nature of surrounding land	Conflicts with rural nature of surrounding land only connects to local road	Surrounding land is developed urban	2 Surrounding land is developed urban	Surrounding land is developed urban	2 Surrounding land is developed urban	2 Surrounding land is developed urban	Surrounding land is developed urban although longer local road section	2 Surrounding land is developed urban although longer local road section	Conflicts with general rural nature of Pukemapu Rd. Oropi Rd becomes more urban
	Safety - how will the access affect the safety of people using the transport network? Does the access promote personal security?	greater impact.	Potentially dangerous access intersection, with mitigation. Poor onward facilities for peds/cycles.	Improved safety of access intersection but poor onward safety for peds/cycles	Improved safety of access intersection but poor onward safety for peds/cycles	Assumes route to Waimapu Pa Road is sale but no orward facilities will not be safe for peds/cycles	Narrow access but reasonably direct connection to Hollister provides reasonably safe access	Direct access to Hollister provides reasonably sale access good natural personal security	Direct access to Hollister provides reasonably safe access good natural personal security	Access to local road with low traffic volumes and footpaths provides good level of safety and personal security	Access to local road with low traffic volumes and tootpaths provides good level of safety and personal security	Access to local road with low traffic volumes and footpaths provides good level of safety and personal security	Access to local road with low traffic volumes and footpaths provides good level of safety and personal security	Potentially risky access intersection. No safety features on Oropi Rd. Low personal security features
	Directness – does the access enable direct travel options to collector roads and near by opportunities (schools, jobs, recreation etc).		Indirect route via Pukemapu Rd / Oropi Road to SH. Limited local facilities / destinations	Indirect route via Pukemapu Rd / Oropi Road to SH. Limited local facilities / destinations	Indirect route via Pukemapu Rd / Oropi Road to SH. Limited local facilities / destinations	Very indirect route to Waimapu Pa Rd and on to SH. No local destinations served.	Route via narrow winding access way but reasonably close to collector road.	Slightly indirect access to collector road some local destinations, parks etc.	Direct access to collector road some local destinations, parks etc.	Less direct access to collector road some local destinations, parks etc.	Less direct access to collector road some local destinations, parks etc.	Less direct access to collector road.	Less direct access to collector road.	Indirect route via Pukemapu Rd / 1 Oropi Road to SH. Limited local facilities / destinations
	Geotechnical: High level consideration of known ground conditions, stability	Options with least difficult geotechnical conditions score higher and most difficult scores lower.	Steep existing slopes. Retaining walls.	Steep existing slopes. Work required in poor ground conditions. Retaining walls.	Steep existing slopes. Work required in poor ground conditions Retaining walls.	2 Steep existing slopes.	Steep existing slopes. Work required in low-lying area with poor ground conditions and in sensitive environment.	Steep existing slopes. Work required in low-lying area with poor ground conditions and in sensitive environment.	Steep existing slopes. Work required in low-lying area with poor ground conditions and in sensitive environment.	Minor remedial work required to existing slopes. Adjacent to stormwater pond.	Minor remedial work required to existing slopes.	2 Major remedial work required to existing slopes. Retaining walls.	Major remedial work required to existing slopes. Large retaining walls.	-1 Steep existing slopes. Large retaining walls.
Geotechnical and	Constructability: Is the access in such a location or subject to other constraints as to 1 make construction very difficult? Including impact on services and level of disruption during construction	Options with easiest access to construct score higher: most difficult to construct score lower	Large quantities of earthworks to be moved. Possible retaining walls. Good access for construction vehicles.	Route requires bridge. Large quantities of earthworks to be moved. Possible retaining walls. Good access for construction vehicles.	Route requires bridge. Large quantities of earthworks to be moved. Possible retaining walls. Good access for construction vehicles.	Large quantities of earthworks to be moved. Long length of new road. Good access for construction vehicles.	Route requires bridge. Construction access restricted and near residential areas. Vibration risk. Work in low-lying wet areas required.	Route requires bridge. Construction access restricted and near residential areas. Vibration risk. Work in low-lying wet areas required.	Route requires bridge. Construction access restricted and near residential areas. Vibration risk. Work in low-lying wet areas required.	Some access restriction and near residential area. Vibration risk. Close proximity to low-lying area.	Some access restriction and near residential area. Vibration risk.	Some access restriction and near residential area. Vibration risk. Temporary accessways required for residents. Large quantity of earthworks to be moved. Long length of new road. Potential retaining walls.	Some access restriction and vibration risk. Temporary accessways required for 1 residents. Large quantity of earthworks to be moved. Long length of new road. Potential large retaining walls.	Large quantities of earthworks to be moved. Long length of new road. Work in low-lying area required. Potential large retaining walls.
Infrastructure	Three waters: How well does the option 1 support provisions for three waters servicing of the site	Options that enable / support efficient three waters servicing score higher	Distance to rider main >500m. Distance to bulk main >500m. Access road will require stormwater system external to development.	Distance to rider main >500m. Distance to bulk main >500m. Access road will require stormwater system external to development.	Distance to rider main >200m. Distance to bulk main <500m. Access road will require stormwater system external to development.	Distance to rider main >500m. Distance to bulk main >500m. Access road will require stormwater system external to development.	Distance to fider main <200m. Distance to bulk main >500m. Access road stormwater to be managed within development.	Distance to rider main <200m. Distance to bulk main >500m. Access road stormwater to be managed within development.	Distance to rider main <200m. Distance to bulk main >500m. Access road stormwater to be managed within development.	Distance to rider main <200m. Distance to bulk main >500m. Access road stormwater to be managed within development.	Distance to rider main <200m. Distance to bulk main >500m. Access road stormwater to be managed within development.	Distance to rider main >200m. Distance to bulk main >500m. Access road stormwater to be managed within development.	Distance to rider main >200m. Distance to bulk main >500m. Access road stormwater to be managed within development.	Distance to rider main >500m. Distance to bulk main >500m. 0 Access road will require stormwater system external to development.
	Alignment with IDC: How well does the option align with the TCC Infrastructure Development Code (design standards transportation network)	Options that achieve IDC standards (considering the surrounding roads) under the likely road environment post development score higher than options that require upgrades or cannot be upgraded	Local roads between 1500 and 3500vpd require 20m road reserve, parking and berm. Pukemapu will not comply	-2 Local roads between 1500 and 3500vpd require 20m road reserve, parking and berm. Pukemapu will not comply	Local roads between 1500 and 3500vpd require 20m road reserve, parking and berm. Oropi Rd will not comply	Local roads between 1500 and 3500vpd require 20m road reserve, parking and berm. Waimapu Pa Rd will not comply	Local roads between 1500 and 3500vpd require 20m road reserve, parking and berm. Section of Woodleigh Place will not comply	Local roads between 1500 and 3500vpd require 20m road reserve, parking and berm. End of Woodleigh Place will comply	Local roads between 1500 and 3500vpd require 20m road reserve, parking and berm. Hollister Lane will comply	Local roads between 1500 and 3500vpd require 20m road reserve, parking and berm. Bertrowe Drive will not comply	Local roads between 1500 and 3500vpd require 20m road reserve, parking and berm.Rowesdale Drive will comply	Local roads between 1500 and 3500vpd require 20m road reserve, parking and berm. Damien Place will not comply	Local roads between 1500 and 3500vpd require 20m road reserve, parking and berm. Mervyn Place will comply	Local roads between 1500 and 3500vpd require 20m road reserve, parking and berm. Pukemapu Road will not comply
	Cultural: Is the area in the vicinity of the access a site of cultural, spiritual or other significance?	Options with less impact on cultural heritage score higher and options that result in greatest impact on cultural heritage score lower. Given that there is exidence of occupation in the vicinity of the size any Nature development is likely to need a cultural impact assessment. Scoring loss trailed potential need for CIAs am mulpice bowned ML-3, Maon owned land -2, other adjacent undeveloped sites -1, adjacent developed land to.	Potential cultural values as adjacent property Polke S Block. Access assumed not to encroach. Further cultural assessment needed.	Potential cultural values as adjacent properly Polike 5 Block. Access may encroach. Further cultural assessment needed.	Crosses land in Maori ownership. Engagement and further cultural assessment needed.	Crosses land in Maori ownership. Engagement and further cultural assessment needed.	Crosses General title land, potentially greater impact on te mane o te wait than 7 or 6	Crosses General title land, potentially greater impact on te mans o te wai than 7 or 8	Crosses General title land. potentially greater impact on te mana o te wai than 7 or 8	-1 Crosses General title land	Crosses General title land	0 Crosses General title land	Crosses General title land	-1 Crosses General title land -1
	Historic Heritage and Archaeology: Are there known historic heritage or archaeological sites in the vicinity of the access?	Options with less impact on historic heritage and archaeology score higher and options that result in greatest impact on historic heritage and archaeology score lower.	Possible site U14/3726 at bottom of driveway. Need further archaeological assessment	Possible site U14/3726 at bottom of driveway. Need further archaeological assessment	Four sites in adjacent property close to connection. Need further archaeological assessment	No sites identified on ArchSite on access property but close to and surrounded by identified sites. Further archaeological assessment needed.	No sites identified in vicinity.	2 No sites identified in vicinity.	No sites identified in vicinity.	2 No sites identified in vicinity.	Site identified adjacent to Rowesdale Drive. Probably built over.	Two sites identified within Rowesdale probably built over. One site on adjacent land likely to be affected U14/1970.	Two sites potentially affected. Need turther archaeological assessment.	Possible site U14/3728 adjacent to bottom of driveway close to where cyclewsyllocopath cross Pukernayu stream. Need further archaeological assessment
Social / Cultural	Effects on existing community: How will the new access options affect the existing neighbourhood, including character and amenity, and are there other benefits provided to the existing community by forming the access in this location?	Access options that provide greater benefits for the surrounding area will score higher while those with lewer benefits will score lover. Score includes number of indirectly affected and length frontage of affected parties.	Possible access to areas adjacent to site.	Possible access to areas adjacent to site. Potential increase in delays at Oropi Roundabout. No disruption to Rowesdale.	Possible access to areas adjacent to new road, Disbenefits to existing users of Oropi Road. Change in character and amenity to adjacent properties.	Possible access to areas adjacent to	No additional access benefits. Disbenefits along length of Woodleigh Place. Character and amenity affected by increased traffic and change in function of local road.	No additional access benefits Disbenefits to a shorter length of Woodleigh Place. Character and amently affected by increased traffic and change in function of local road.	No additional access benefits no benefits/disbenefits to adjacent area along Hollister Lane (Collector Road joining Collector Road). Minor effect on immediately adjacent properties from new road frontage.	No additional access benefits Disbenefits to a shorter length of Bertrowe Drive. Character and amenity affected by increased traffic and change in function of local road.	No additional access benefits Disbenefits to Rowesdale Drive to Hollister Lane, Damien and Menyny Places. Character and amenity affected by increased traffic and change in function of local road. Affect on large local road catchment.	Additional access benefits to area not in site no benefits to adjacent developed area. Character and amenity affected by increased traffic and change in function of local road. Affect on large local road catchment (but less than Option 8).	Additional access difficult to area not in site. Character and amenity effect of rural tacing area from large fill. Character and amenity affected by increased traffic and change in function of local road. Affect on large local road catchment (but less than Option 8).	Additional access benefits to area not in site. Character and amenity effect on rural facing area. Potential increase in delays at Oropis Roundabout. No disruption to Rowesdale.
	Effects on the new community: How will the new access provide for the new community to be established, including the character and amenity of the newly developed area?		Access currently along this alignment. Do	Access currently along this alignment. Doesn't directly impact on character and amenity of the new area which can respond to design.	Access approx. 800 - 1,000m to Waimapu Road. Could lie directly in to design for new area.	Access approx. 800 - 1,000m to Wa	New bridge and access into site takes up an area of the development and creates impact on character and amenity of new area.	New bridge and access into site takes up an area of the development and creates impact on character and amenity of new area.	New bridge and access into site takes up an area of the development and creates impact on character and amenity of new area.	Connection into site takes up some area and impacts on character and amenity with fill over a short distance. Access closer to grade likely to have less impact than adjacent options.	Connection into site takes up some area and impacts on character and amenity with fill over a short distance.	New access enters site at grade with no additional effect on new development.	New access enters site at grade with no additional effect on new development.	New access enters site at grade with no additional effect on new development.
	Land ownership: How many landowners, other than those within the site to be accessed, are directly affected by the option? Count no. landowners required to obtain land directly affected. Count no. Landowners to nearest Collector Road (land not required) as indirectly affected.	Options with fewer number of landowners directly affected will score higher	2 properties (one multiple owned ML) directly affected assuming access required across property to the west. No properties indirectly affected.	2 properties (one multiple owned ML) directly affected assuming access required across property to the west. No properties indirectly affected.	3 directly properties affected assuming access to Oropi Road (bridge required)	3 properties directly affected assuming access to Waimapu Pa Road (no bridge required)	6 properties directly affected to provide for a road width along the right-of-way at the end of Woodleigh PL 27 indirectly affected to Hollister Lane.	3 properties directly affected. 4 indirectly affected.	1 2 properties directly affected. 4 indirectly affected.	2 1 property directly affected. 11 properties indirectly affected.	No privately owned properties directly affected (both TCC owned). 88 indirectly affected - Menyn Place, Damine Place and Rowesdale Drive to the intersection with Holister Lane	8 properties directly affected. 48 indirectly affected - Mervyn Place, Damien Place and Rowesdale Drive to the intersection with Hollister Lane	8 properties directly affected. 48 indirectly affected - Mervyn Place, Damien Place and Rowesdale Drive to the intersection with Hollister Lane	-2 3 properties directly affected 1
	Noise: Will adjacent property owners be affected by increased levels of traffic noise?	Access options with lower noise impacts will score higher than options that have a greater impact.	Few dwellings close to the access road on Pukemapu Rd side	Few dwellings close to the access road on Pukemapu Rd side	Few dwellings close to the access road on Oropi Rd side	Some noise impacts to residents in quite Waimapu Pa Rd	-2 Impact to small number of dwellings on access right of way	Impact to small number of dwellings on access right of way	-1 Small number of neighbouring residents effected	-1 Small number of neighbouring residents effected	Small number of neighbouring residents effected	Small number of neighbouring residents effected	-1 Small number of neighbouring residents effected	-1 Steep access higher noise levels 1
Natural and Physical Environment	Ecology: How will the construction and operation of the access affect animal and plant ecology; loss of habitat, disruption of territorial domains, and interruption of ecological contrilors?	Options with less impact on ecology score higher and options that result in greater impact on ecology score lower. Where access crosses areas containing floodplain, wetland or streams/overland flow paths score will be lower than where these areas are not	Flood area along stream and down driveway	-1 Flood area along stream and down driveway	Minor flooding along site boundary. Flooding towards Waimapu Road	1 Flooding towards Waimapu Road	Gully between Woodleigh Place and site	-2 Gully between Woodleigh Place and site	-2 Minor flooding and gully along edge of site	-2 Overland flow path along rear of properties that would be affected	Overland flow path along rear of properties that would be affected	Overland flow path along rear of properties that would be affected	-1 Flooding along Pukemapu Stream	-1 Flooding along Pukemapu Stream and along gully
	Impact of the access: Including the footprint of the access, landscape and visual effects on the surrounding area, carbon and resilience impacts.	Smaller footprints (for access), less carbon use, less landscape and visual effects and lower carbon use will be scored higher. Overall assessment: Significant = -2 More than minor = -1, Minor = 0, Less than minor = +1 De minimis = +2	overall impact. Includes pedestrian and	Widening existing access limited overall impact. Includes new bridge over the Pukemapu Stream.	Large footprint, high carbon impact with new bridge required. Landscape and visual impacts in the rural landscape.	Large footprint, moderate carbon impact. Landscape and visual impacts in the rural landscape.	Large footprint, high carbon impact with new bridge required. Landscape and visual impacts of bridge across gully.	Large footprint, high carbon impact with new bridge required. Landscape and visual impacts of bridge across gully.	Large footprint, high carbon impact with new bridge required. Landscape and visual impacts of bridge across gully.	-2 Smaller footprint limited carbon and landscape and visual impact	1 Smaller footprint limited carbon and landscape and visual impact	1 Moderate footprint with high fill areas, limited carbon impact.	Large footprint with high fill areas, moderate carbon impact.	-2 Large footprint with high fill areas, moderate carbon impact.
Site Acquisition	How difficult will land for the access be to acquire.	Acquisition on the basis or a willing seler/willing puper will score higher than acquisition requiring Public Works Act processes. TCC owned land =+3. Land required but no engagement 1 or 2 lots = 0. Land required, no engagement >2 lots -1. Land required Maort-owned = -2. Land required, no engagement,	1 property required, no engagement.	2 properties required. Multiple owned Maori land	3 properties required. Maori	3 properties required. Maori owned	-2 6 properties required	-1 3 properties required	-1 2 properties required.	-1 1 property required	2 properties required both owned by TCC	3 4 properties required	-1 4 properties required	-2 3 properties required -1
Consentability	How difficult would it be to consent the construction of the proposed access in the chosen location taking into account both 1 Territorial Authority processes (resource consent/designation and contaminated land) and Regional Authority consents (earthworks/stormwater).	Access options that are easier to consent will score higher while those that are more difficult will score lower. Potential consents: Designation, Earthworks, NES-F, NES-C, Schromwater, Designation only = +1, less 1 pt for each additional consent.	Resource consent/Designation, earthworks across Maori owned land	Resource consent/Designation, earthworks, New alignment across wetland and new bridge, also across Maori owned land	Resource consent/ Designation, earthworks, NES-SC, NES-F across Pukemapu stream floodplain	Resource consent/Designation, earthworks, NES-SC across Maori owned land	Resource consent/Designation, Earthworks, NES-F,	Resource consent/Designation, Earthworks, NES-F,	Resource consent/Designation, Earthworks, NES-F, access through orchard NES-CS	-1 Resource consent/Designation, access through orchard NES-CS	Resource consent/Designation, access through orchard NES-CS	1 Resource consent/Designation, earthworks	-1 Resource consent/Designation, earthworks.	-1 Resource consent/Designation, earthworks, NES-F
Development outcomes	How well does the option support development outcomes, e.g. maximise or impact development yield	Options that have the least impact on development capacity score higher	No accessway footprint	3 No accessway footprint 3	No accessway footprint	No accessway footprint	3 Accessway footprint >1000m2	-1 Accessway footprint >1000m2	-1 Accessway footprint >1000m2	-1 Accessway footprint <1000m2	3 Accessway footprint <1000m2	3 No accessway footprint	3 No accessway footprint	3 No accessway footprint 3
TOTAL SCORE	19		Option 1	-6 Option 1b -1	O Option 2 -	Option 3	21 Option 4	Option 5	-2 Option 6	1 Option 7	14 Option 8	20 Option 9	Option 10a	-4 Option 11 -10
High-level cost	What is the comparative high level indicative cost of the option? Including land acquisition considerations	Lower indicative cost scores higher with greater comparative cost scoring less. Road bridge scores most expensive. Pedestrian cycle bridge scores next towest	High construction cost due to large volume of earthworks (>5000m3) and long length of road. Medium cost of land acquisition for the purchase of one large properly and easement required through general title land. Additional safety works required for Pulkemapu Rd. Cycleway connection (bridge) back to Ohaulit Road.	High construction cost due to large volume of earthworks (>5000mS), bridge Modum cost of land acqualition for the purchase of one large properly and assement required through general site land. Additional safety works regular bright properties of the purchase of purchase of the purchase of the purchase of the purchase of the purchase of the purchase of large Additional purchase	High construction cost due to large volume of earthworks (>500m3), bridge construction and long length of road. Medium cost of land acquisition for the purchase of one residential properly and easement required through general title land.	High construction cost due to large volume of earthworks (>:500m3) and long length of social. Medium cost of land acquisition for the purchase of one large property and essement required through general title land.	High construction cost due to bridge. High cost of land acquisition for the pruchase of 6 residential properties.	High construction cost due to bridge. High cost of land acquisition for the pruchase of 4 residential properties.	High construction cost due to bridge. High cost of land acquilibility for the pruchase of 2 residential properties.	Low construction cost. Medium \$55555 cost of land acquisition for purchase of 2 properties.	Low construction cost. Medium \$ cost of land acquisition for purchase of 2 properties.	Medium construction cost. High land acquisition cost required for purchase of 8 properties.	High construction cost. High land acquisition cost required for purchase of 14 properties.	High construction cost due to large earthwork volumes and long length of road. Medium land acquisition cost for purchase of 2 properties. 555555 Friedrich (2005) Friedrich

	OPTIONS	1	Option 1	Option 1b	Option 2	Option 3	Option 4	Option 5	Option 6	Option 7	Option 8	Option 9	Option 10a	Option 11
	Network integration – how well does the access integrate with the wider transport network, including for cyclists, pedestrians, PT private cars and service vehicles. Does the option support future opportunities to integrate across the site?		Indirect route to Collector Road. No PT routes. Would require pedicycle facility to Oropi Rd and wider connections. Some benefit in cross site connectivity	Indirect route to Collector Road. No PT routes. Would require ped/cycle facility to Oropi Rd and wider connections. Some benefit in cross site connectivity	Indirect route to Collector Road. No PT routes. Would require ped/cycle facility to Oropi Rd and wider connections. Some benefit in cross site connectivity	Very long route to Collector Road. No PT routes. Would require dedicated ped/cycle facility to Polike Rd and wider connections. No cross connection benefit	Routes to collector road via narrow accessway. Difficult to provide pedfoycle connection. Impact on congestion at Polike Rd	Direct route to collector road with PT access. Able to provide 1 pedicycle facility. Supports future cross connection. Impact on congestion at Polike Rd	Direct route to collector road with PT access. Able to provide pedicycle facility. Supports future cross connection. Impact on congestion at Polike Rd	Direct route to collector road with PT access however uses narrow local road. Able to provide ped/cycle facility. Supports future cross connection. Impact on congestion at Polke Rd	Routes to collector road via short local road section, with PT access. 1 Able to provide ped(cycle facility. Supports future cross connection. Impact on congestion at Poike Rd	Indirect route to collector road with PT access. Assume ped cycle path can be provided. Does not support direct cross site connectivity.	Indirect route to collector road with PT access. Assume ped cycle path can be provided. Does not support direct cross site connectivity.	Indirect route to Collector Road. Would require ped/cycle facility to 1 Oropi Rd and wider connections. Some benefit in cross site connectivity
Transport	Land use integration – how well does the option integrate with surrounding land use, or conflict.	Options with fewer impacts / effects on network function, cycle, pedestrian, PT access, integration, safety and directness score higher than those with a	Conflicts with general rural nature of Pukemapu Rd. Oropi Rd becomes more urban	-1 Conflicts with general rural nature of Pukemapu Rd. Oropi Rd becomes more urban	Conflicts with rural nature of surrounding land	Conflicts with rural nature of surrounding land only connects to local road	Surrounding land is developed urban	2 Surrounding land is developed urban	2 Surrounding land is developed urban	2 Surrounding land is developed urban	2 Surrounding land is developed urban	Surrounding land is developed urban although longer local road section	Surrounding land is developed urban although longer local road section	Conflicts with general rural nature of Pukemapu Rd. Oropi Rd becomes more urban
	Safety - how will the access affect the safety of people using the transport network? Does the access promote personal security?	greater impact.	Potentially dangerous access intersection, with mitigation. Poor onward facilities for peds/cycles.	-2 Improved safety of access intersection but poor onward safety for peds/cycles	Improved safety of access intersection but poor onward safety for peds/cycles	Assumes route to Waimapu Pa Road is safe but no onward facilities will not be safe for peds/cycles	-2 Narrow access but reasonably direct connection to Hollister provides reasonably safe access	Direct access to Hollister provides reasonably safe access good natural personal security	Direct access to Hollister provides reasonably safe access good natural personal security	Access to local road with low traffic volumes and footpaths provides good level of safety and personal security	Access to local road with low traffic volumes and footpaths provides good level of safety and personal security	Access to local road with low traffic volumes and footpaths provides good level of safety and personal security	Access to local road with low traffic volumes and footpaths provides good level of safety and personal security	Potentially risky access intersection. No safety features on Oropi Rd. Low personal security features
	Directness – does the access enable direct travel options to collector roads and near by opportunities (schools, jobs, recreation etc).		Indirect route via Pukemapu Rd / Oropi Road to SH. Limited local facilities / destinations	-1 Indirect route via Pukemapu Rd / Oropi Road to SH. Limited local facilities / destinations	Indirect route via Pukemapu Rd / Oropi Road to SH. Limited local facilities / destinations	Very indirect route to Waimapu Pa Rd and on to SH. No local destinations served.	Route via narrow winding access way but reasonably close to collector road.	Slightly indirect access to collector road some local destinations, parks etc.	Direct access to collector road some local destinations, parks etc.	Less direct access to collector road some local destinations, parks etc.	Less direct access to collector road some local destinations, parks etc.	Less direct access to collector road.	Less direct access to collector road.	1 Indirect route via Pukemapu Rd / Oropi Road to SH. Limited local facilities / destinations
	0.8 Geotechnical: High level consideration of known ground conditions, stability	Options with least difficult geotechnical conditions score higher and most difficult scores lower.	Steep existing slopes. Retaining walls.	-1 Steep existing slopes. Work required in poor ground conditions. Retaining walls.	Steep existing slopes. Work required in poor ground conditions. Retaining walls.	2 Steep existing slopes.	Steep existing slopes. Work required in low-lying area with poor ground conditions and in sensitive environment.	Steep existing slopes. Work required in low-lying area with poor ground conditions and in sensitive environment.	Steep existing slopes. Work required in low-lying area with poor ground conditions and in sensitive environment.	Minor remedial work required to existing slopes. Adjacent to stormwater pond.	1 Minor remedial work required to existing slopes.	Major remedial work required to existing slopes. Retaining walls.	Major remedial work required to existing slopes. Large retaining walls.	-1 Steep existing slopes. Large retaining walls.
Geotechnical and	Constructability: Is the access in such a location or subject to other constraints as to make construction very difficult? Including impact on services and level of disruption during construction	Options with easiest access to construct score highermost difficult to construct score lower	Large quantities of earthworks to be moved. Possible retaining walls. Good access for construction vehicles.	Route requires bridge. Large quantities of earthworks to be moved. Possible retaining walls. Good access for construction vehicles.	Route requires bridge. Large quantities of earthworks to be moved. Possible retaining walls. Good access for construction vehicles.	Large quantities of earthworks to be moved. Long length of new road. Good access for construction vehicles.	Route requires bridge. Construction access restricted and near residential areas. Vibration risk. Work in low-lying wet areas required.	Route requires bridge. Construction access restricted and near residential areas. Vibration risk. Work in low-lying wet areas required.	Route requires bridge. Construction access restricted and near residential areas. Vibration risk. Work in low-lying wet areas required.	Some access restriction and near residential area. Vibration risk. Close proximity to low-lying area.	Some access restriction and near residential area. Vibration risk.	Some access restriction and near residential area. Vibration risk. Temporary accessways required for residents. Large quantity of earthworks to be moved. Long length of new road. Potential retaining walls.	Some access restriction and vibration risk. Temporary accessways required for residents. Large quantity of earthworks to be moved. Long length of new road. Potential large retaining walls.	Large quantities of earthworks to be moved. Long length of new road. Work in low-lying area required. Potential large retaining walls.
Infrastructure	Three waters: How well does the option support provisions for three waters servicing of the site	Options that enable / support efficient three waters servicing score higher	Distance to rider main >500m. Distance to bulk main >500m. Access road will require stormwater system external to development.	Distance to rider main >500m. Distance to bulk main >500m. Access road will require stormwater system external to development.	Distance to rider main >200m. Distance to bulk main <500m. Access road will require stormwater system external to development.	Distance to rider main >500m. Distance to bulk main >500m. Access road will require stormwater system external to development.	Distance to rider main <200m. Distance to bulk main >500m. Access road stormwater to be managed within development.	Distance to rider main <200m. Distance to bulk main >500m. Access road stormwater to be managed within development.	Distance to rider main <200m. Distance to bulk main >500m. Access road stormwater to be managed within development.	Distance to rider main <200m. Distance to bulk main >500m. Access road stormwater to be managed within development.	Distance to rider main <200m. Distance to bulk main >500m. Access road stormwater to be managed within development.	Distance to rider main >200m. Distance to bulk main >500m. Access road stormwater to be managed within development.	Distance to rider main >200m. Distance to bulk main >500m. Access road stormwater to be managed within development.	Distance to rider main >500m. Distance to bulk main >500m. O Access road will require 1 stormwater system external to development.
	Alignment with IDC: How well does the option align with the TCC Infrastructure Development Code (design standards transportation network)	Options that achieve IDC standards (considering the surrounding roads) under the likely road environment post development score higher than options that require upgrades or cannot be upgraded	Local roads between 1500 and 3500vpd require 20m road reserve, parking and berm. Pukemapu will not comply	Local roads between 1500 and 3500vpd require 20m road reserve, parking and berm. Pukemapu will not comply	Local roads between 1500 and 3500vpd require 20m road reserve, parking and berm. Oropi Rd will not comply	Local roads between 1500 and 3500vpd require 20m road reserve, parking and berm. Waimapu Pa Rd will not comply	Local roads between 1500 and 3500vpd require 20m road reserve, parking and berm. Section of Woodleigh Place will not comply	Local roads between 1500 and 3500vpd require 20m road reserve, parking and berm. End of Woodleigh Place will comply	Local roads between 1500 and 3500vpd require 20m road reserve, parking and berm. Hollister Lane will comply	Local roads between 1500 and 3500vpd require 20m road reserve, parking and berm. Bertrowe Drive will not comply	Local roads between 1500 and 3500vpd require 20m road reserve, parking and berm.Rowesdale Drive will comply	Local roads between 1500 and 3500vpd require 20m road reserve, parking and berm. Damien Place will not comply	Local roads between 1500 and 3500vpd require 20m road reserve, parking and berm. Mervyn Place will comply	Local roads between 1500 and 3500vpd require 20m road reserve, parking and berm. Pukemapu Road will not comply
	Culturat: Is the area in the vicinity of the access a site of cultural, spiritual or other significance?	Options with less impact on cultural heritage score higher and options that result in greatest impact on cultural heritage score lower. Given that there is exidence of occupation in the vicinity of the site any? Muture development is likely to need a cultural impact assessment. Scoring has ranked potential need for CIA as multiple owned ML-3, Maon owned land -2, other adjacent undeveloped sites -1, adjacent developed and and a site of the control of th	Potential cultural values as adjacent property Polke 5 Block. Access assumed not to encoach. Further cultural assessment needed.	Potential cultural values as adjacent property Polike 5 Block. Access may encroach, Further cultural assessment needed.	Crosses land in Maori ownership. Engagement and further cultural assessment needed.	Crosses land in Maori ownership. Engagement and further cultural assessment needed.	Crosses General title land, potentially greater impact on te mans o te wall than 7 or 8	Crosses General title land, potentially greater impact on te mans a te wai than 7 or 8	Crosses General title land. 1 potentially greater impact on te mana o te wai than 7 or 8	-1 Crosses General title land	0 Crosses General title land	0 Crosses General title land	Crosses General title land	-1 Crosses General title land -1
	Historic Heritage and Archaeology: Are there known historic heritage or archaeologica sites in the vicinity of the access?	Options with less impact on historic heritage and archaeology score higher and options that result in greatest impact on historic heritage and archaeology score lower.	Possible site U14/3726 at bottom of driveway. Need further archaeological assessment	Possible site U14/3726 at bottom of driveway. Need further archaeological assessment	Four sites in adjacent property close to connection. Need further archaeological assessment	No sites identified on ArchSite on access property but close to and surrounded by identified sites. Further archaeological assessment needed.	No sites identified in vicinity.	No sites identified in vicinity.	No sites identified in vicinity.	2 No sites identified in vicinity.	Site identified adjacent to Rowesdale Drive. Probably built over.	Two sites identified within Rowesdale probably built over. One site on adjacent land likely to be affected U14/1970.	Two sites potentially affected. Need further archaeological assessment.	Possible site U14/3726 adjacent to bottom of driveway close to where cycleway/footpath cross Pukemapu stream. Need further archaeological assessment
Social / Cultural	Effects on existing community: How will the new access options affect the existing new access options affect the existing 1.5 agents of the existing community by forming the access in this location?	Access options that provide greater benefits for the surrounding area will score higher while those with level benefits will score lover. Score includes number of indirectly affected and length frontage of affected parties.	Possible access to areas adjacent to site.	Possible access to areas adjacent to site. Potential increase in delays at Oropi Roundabout. No disruption to Rowesdale.	Possible access to areas adjacent to new road. Disbenefits to existing users of Oropi Road. Change in character and amenity to adjacent properties.	Possible access to areas adjacent to	No additional access benefits. Disbenefits along length of Woodleigh Place. Character and amenity affected by increased traffic and change in function of local road.	No additional access benefits Disbenefits to a shorter length of Woodleigh Place. Character and amently affected by increased traffic and change in function of local road.	No additional access benefits no benefits/disbenefits to adjacent area along Hollister Lane (Collector Road joining Collector Road). Minor effect on immediately adjacent properties from new road frontage.	No additional access benefits Disbenefits to a shorter length of Bertrowe Drive. Character and amenity affected by increased traffic and change in function of local road.	No additional access benefits Disbenefits to Rowesdale Drive to Hollister Lane, Damien and Menyn Places. Character and amenity affected by increased traffic and change in function of local road. Affect on large local road catchment.	Additional access benefits to area not in site no benefits to adjacent developed area. Character and amenity affected by increased traffic and change in function of local road. Affect on large local road catchment (but less than Option 8).	Additional access difficult to area not in site. Character and amenity effect of rural tacing area from large fill. Character and amenity affected by increased traffic and charge in function of local road. Affect on large local road catchment (but less than Option 8).	Additional access benefits to area not in site. Character and amenity effect on rural facing area. Potential increase in delays at Oropi Roundabout. No disruption to Rowesdale.
	1.5 Effects on the new community: How will the new access provide for the new community to be established, including the character and amenity of the newly developed area?		Access currently along this alignment. Do	Access currently along this alignment. Doesn't directly impact on character and amenity of the new area which can respond to design.	Access approx. 800 - 1,000m to Waimapu Road. Could tie directly in to design for new area.	O Access approx. 800 - 1,000m to Wa	New bridge and access into site takes up an area of the development and creates impact on character and amenity of new area.	New bridge and access into site takes up an area of the development and creates impact on character and amenity of new area.	New bridge and access into site takes up an area of the development and creates impact on character and amenity of new area.	Connection into site takes up some area and impacts on character and amenity with fill over a short distance. Access closer to grade likely to have less impact than adjacent options.	Connection into site takes up some area and impacts on character and amenity with fill over a short distance.	-1 New access enters site at grade with no additional effect on new development.	New access enters site at grade with no additional effect on new development.	New access enters site at grade with no additional effect on new development.
	Land ownership: How many landowners, other than those within the site to be accessed, are directly affected by the option? Court no. landowners required to obtain land directly affected. Court no. landowners to nearest Collector Road (land not required) as indirectly affected.	Options with fewer number of landowners directly affected will score higher	2 properties (one multiple owned ML) directly affected assuming access required across property to the west. No properties indirectly affected.	2 properties (one multiple owned ML) directly affected assuming access required across property to the west. No properties indirectly affected.	3 directly properties affected assuming access to Oropi Road (bridge required)	3 properties directly affected assuming access to Waimapu Pa Road (no bridge required)	6 properties directly affected to provide for a road width along the right-of-way at the end of Woodleigh PL 27 indirectly affected to Hollister Lane.	3 properties directly affected. 4 indirectly affected.	1 2 properties directly affected. 4 indirectly affected.	2 1 property directly affected. 11 properties indirectly affected.	No privately owned properties directly affected (both TCC owned). 68 indirectly affected - Mervyn Place, Damien Place and Rowesdale Drive to the intersection with Hollister Lane	8 properties directly affected. 48 indirectly affected - Mervyn Place, Damien Place and Rowesdale Drive to the intersection with Hollister Lane	8 properties directly affected. 48 indirectly affected - Mervyn Place, Damien Place and Rowesdale Drive to the intersection with Hollister Lane	-2 3 properties directly affected 1
	1.5 Noise: Will adjacent property owners be affected by increased levels of traffic noise?	Access options with lower noise impacts will score higher than options that have a greater impact.	Few dwellings close to the access road on Pukemapu Rd side	2 Few dwellings close to the access road on Pukemapu Rd side	Few dwellings close to the access road on Oropi Rd side	2 Some noise impacts to residents in quite Waimapu Pa Rd	-2 Impact to small number of dwellings on access right of way	-1 Impact to small number of dwellings on access right of way	-1 Small number of neighbouring residents effected	-1 Small number of neighbouring residents effected	-1 Small number of neighbouring residents effected	-1 Small number of neighbouring residents effected	-1 Small number of neighbouring residents effected	-1 Steep access higher noise levels but few nearby properties 1
Natural and Physical Environment	Ecology: How will the construction and operation of the access affect animal and plant ecology; loss of habitat, disruption of territorial domains, and interruption of ecological corridors?	Options with less impact on ecology score higher and options that result in greater impact on ecology score tower. Where access crosses areas containing floodplain, wetland or streams/overland flow paths score will be lower than where these areas are not affected.	Flood area along stream and down driveway	-1 Flood area along stream and down driveway	Minor flooding along site boundary. Flooding towards Waimapu Road	-1 Flooding towards Waimapu Road	Gully between Woodleigh Place and site	-2 Gully between Woodleigh Place and site	-2 Minor flooding and gully along edge of site	-2 Overland flow path along rear of properties that would be affected	-1 Overland flow path along rear of properties that would be affected	Overland flow path along rear of properties that would be affected	-1 Flooding along Pukemapu Stream	-1 Flooding along Pukemapu Stream -2
	Impact of the access: Including the footprint of the access, landscape and visual effects on the surrounding area, carbon and resilience impacts.	More than minor = -1, Minor = 0, Less than minor = +1 De minimis = +2	, overall impact. Includes pedestrian and	Widening existing access limited overall impact. Includes new bridge over the Pukemapu Stream.	Large footprint, high carbon impact with new bridge required. Landscape and visual impacts in the rural landscape.	Large footprint, moderate carbon impact. Landscape and visual impacts in the rural landscape.	Large footprint, high carbon impact with new bridge required. Landscape and visual impacts of bridge across gully.	Large footprint, high carbon impact with new bridge required. Landscape and visual impacts of bridge across gully.	Large footprint, high carbon impact with new bridge required. Landscape and visual impacts of bridge across gully.	-2 Smaller footprint limited carbon and landscape and visual impact	Smaller footprint limited carbon and landscape and visual impact	1 Moderate footprint with high fill areas, limited carbon impact.	-1 Large tootprint with high fill areas, moderate carbon impact.	-2 Large footprint with high fill areas, moderate carbon impact.
Site Acquisition	O.8 How difficult will land for the access be to acquire.	Augustion on the basis or a willing seller/milling outper will score higher than acquisition requiring Public Works Act processes. TCC owned land +3. Land required but no engagement 1 or 2 lots = 0. Land required, no engagement 2 lots -1. Land required Maori-owned = -2. Land required, no engagement,	1 property required, no engagement.	-3 2 properties required. Multiple owned Maori land	3 3 properties required. Maori owned	.2 3 properties required. Maori owned	-2 6 properties required	-1 3 properties required	-1 2 properties required.	-1 1 property required	0 2 properties required both owned by TCC	3 4 properties required	-1 4 properties required	-2 3 properties required -1
Consentability	How difficult would it be to consent the construction of the proposed access in the chosen location taking into account both 1.5 Territorial Authority processes (resource consent/designation and contaminated land) and Regional Authority consents (earthworks/stormwater)?	Access options that are easier to consent will score higher while those that are more difficult will score lower. Potential consents: Designation, Earthworks, NES-F, NES-CS, Commwater, Designation only = +1, less 1 pt for each additional consent.	Resource consent/Designation, earthworks across Maori owned land	Resource consent/Designation, earthworks, New alignment across wetland and new bridge, also across Macri owned land	Resource consent/ Designation, earthworks, NES-SC, NES-F across Pukemapu stream floodplain	Resource consent/Designation, earthworks, NES-SC across Maori owned land	-2 Resource consent/Designation, Earthworks, NES-F,	Resource consent/Designation, Earthworks, NES-F,	Resource consent/Designation, Earthworks, NES-F, access through orchard NES-CS	Resource consent/Designation, access through orchard NES-CS	1 Resource consent/Designation, access through orchard NES-CS	1 Resource consent/Designation, earthworks	-1 Resource consent/Designation, earthworks.	-1 Resource consent/Designation, earthworks, NES-F
Development outcomes	How well does the option support development outcomes, e.g. maximise or impact development yield	Options that have the least impact on development capacity score higher	No accessway footprint	3 No accessway footprint	3 No accessway footprint	3 No accessway footprint	3 Accessway footprint >1000m2	-1 Accessway footprint >1000m2	-1 Accessway footprint >1000m2	-1 Accessway footprint <1000m2	3 Accessway footprint <1000m2	3 No accessway footprint	3 No accessway footprint	3 No accessway footprint 3
TOTAL SCORE	19		Option 1	-2 Option 1b	-6 Option 2	Option 3	Option 4	-14 Option 5	-3 Option 6	2 Option 7	17 Option 8	19 Option 9	Option 10a	-5 Option 11 -7
High-level cost	What is the comparative high level indicative cost of the option? Including land acquisition considerations	Lower indicative cost scores higher with greater comparative cost scoring less. Road bridge scores most expensive, Pedestrian cycle bridge scores next lowest.	High construction cost due to large volume of earthworks (>5000m3) and long length of road. Medium cost of land acquisition for the purchase of one large property and easement required through general title land. Additional safety works required for Pukemapu Rd. Cycleway connection (bridge) back	High construction cost due to large volume of earthworks (>5000mS), bridge construction and long length of road. Medium cost of land acquisition for the purchase of one large property and easement required through general title land. Additional safety works required for Pukemapu Rd. Cycleway connection	High construction cost due to large volume of earthworks (>5000mS), bridge construction some of the design of the design of the design of the design of the purchase of one residential property and easement required through general title land.	High construction cost due to large volume of earthworks (-500m3) and iong length of 5555 road. Medium cost of land acquisition for the purchase of one large property and easement required through general title land.	High construction cost due to bridge. High cost of land acquisition for the pruchase of 6 residential properties.	High construction cost due to bridge. High cost of land acquisition for the pruchase of 4 residential properties.	High construction cost due to bridge. High cost of land acquisition for the pruchase of 2 residential properties.	Low construction cost. Medium cost of land acquisition for purchase of 2 properties.	Low construction cost. Medium cost of land acquisition for purchase of 2 properties.	Medium construction cost. High land acquisition cost required for purchase of 8 5 properties.	High construction cost. High land acquisition cost required for purchase of 14 properties.	High construction cost due to large earthwork volumes and long length of road. Medium land acquisition of road propurbase of 2 properties. Additional safety works required for Pukerapu Rd. Cycleway connection (bridge) back to Ohaulis Road
